William: Before you buy, you might want to check out the SGC 231 tuner. If it's in your price range and you have a good place to mount it and the antenna, the combination is hard to beat. I've had a 231 in my truck for a few months now and it works pretty good. With the matching SGC antenna, it works fine from 75 to 6 meters. It will tune on 160, but don't expect too much unless you have a good sized antenna connected to it. I started out using the matching antenna, but it quickly became apparent that I was going to destroy it in short order (lots of low tree branches on the seasonal roads and trails here). The nice thing about it is that once you get it tuned on a frequency, which takes a few seconds, it remembers that setting and returns to it in a matter of milliseconds when you come back to that frequency. It is nice to have the remote controls connected to the tuner so you can force it to retune at times, but most of the time it's just fine. To avoid destroying the antenna, I replaced the SGC antenna with a standard stainless CB whip, which I'm unlikely to seriously damage. The tuner handles it just fine. The SGC antenna is however slightly loaded which would make for better efficiency at lower frequencies. I do however have some low band whips I can throw on there if I need to (old Husler stuff). The nice thing about a tuner like the SGC (and perhaps the FC-20) is that when you're parked you can toss a wire over a tree or to a baloon and clip it to the antenna base. The tuner will be REAL happy with that arrangement, particularly if you also clip on to a REAL ground somehow. The SGC's not for everyone, but if you can deal with the mounting it's a primo setup. They also have a strap-on arrangement, but that's way to wierd for me. Other than that, A number of the people I know have the traditional screwdriver antennas and they work real well--a bit big though. Also, I've used an Outbacker with good success. The only problem of course is that it was never set to the band I wanted to operate at the time. Sorry to take this a bit off topic, but I haven't seen an FC-20, so I can't say much about it. One comment though, when you plan your HF mobile antenna installation, try to get as much of the antenna as possible above and away from the body of the car and as much of the body and frame as possible tied together as a counterpoise. Jim:
That sounds a lot like bait for a holy war, but I'll gingerly stick my toe in. What we're talking about here are antennas that are directly fed with a tuner rather than putting a tuner in front of 100' of coax going out to an antenna. Regarding the latter, I'd tend to agree with you for all practical purposes.

Aloha All...
I have built up a new web site at http://www.frii.com/~cayman
for the sole purpose of Antenna and Radio mounting engineering efforts for the FT-100 and the ATAS-100 Antenna.

Engineering drawings of the Antenna mount modifications that Rick from GeoTool and I are working on are also included. Pictures of the Ford Ranger Truck installation that I have, and radio console information as well as cable ideas are also included.

I have been working with Rick at GeoTool to help on the improvement of his awesome Truck "Stake Pocket" mount, and to improve the stability of the ATAS-100 Antenna. We are working on the Weather seal O ring and the surface area problems to compensate for the weight and the torque of the antenna during travel. This web site just became active on Saturday, and there are alot of Engineering reports and some technical drawings and pictures being added every day, but I thought you all would like to see how it has come together...

Please e mail me with information , or if you have questions of how this project came to be... (If own a Ranger truck, you will LOVE this site !)

Aloha,
Steve

Everyone please breath deeply 10 times. There now, don't you feel better? I have no idea what kind of mailer Mike uses. Well, that's not strictly true, he seems to use OE5 on a dual 450 (PII?) machine, but that's beside the point. Mike is a valued member of our community. He'd like to not receive mail marked "urgent" unless it's really urgent. We used to call this netiquette. It was a fine name for a good self administered policy. If we cannot avoid argument over these things, the list will simply degenerate. That would be pitiful. One item of netiquette was a requirement that a followup provide some new information:-) As such, I'd like to let those interested in the FT100 and computers that my current project is reverse engineering the clone data of the Bearcat BC245XLT TrunkTrackerII, and following that I'll be starting on the FT100. When the project is complete, I'll post the results and tools to this list. Oh, almost forgot to mention that I really enjoy my FT100 which has operated beautifully with a mag mount ATAS100 mobile for about 5 months. -Tom, KB7EFZ -----Original Message----- From: Karl.Kanalz@... 1519. 75m, tuners, tuning range, manual vs FC20

Yahoo group: FT100 (1998 — 2000)
Date: 1999-09-13 17:19:41 UTC
From: Walsh, Tom
Topic: 1519 Message: 1519

William & others - The "manual" 300 watt tuner I use is equipped with a balun, and can be attached to ladder line to feed various wire antennae. The FC20 isn't, and would require a balun external to the tuner for such usage. That arrangement is somewhat less efficent than having the balun in the tuner. That point aside, the FC20 can tune something like 2:1 or 3:1 mismatches. The BW300 can tune basically anything, it's really a matter of patience in searching for the match point. An example might suffice. I have a wire antenna fed slightly off center and sized about for 75m. I can tune the antenna (and feedline) to operate on 6m, 10m, ... (all bands). Another example is an "Alpha V58" 5/8 wavelength 10m antenna. This is a gamma matched coax fed single band vertical antenna. Again, the BW300 is able to tune this on all bands (although as noted above, since coax is used, this is not terribly efficient, lots of RF goes to the task of warming up the coax). The FC20 and similar devices would not be up to doing these things. The FC20 and similar devices are pretty good with the task of adjusting for slight mismatches (which would cause the final protection circuitry of your radio to reduce power output) in near resonant antenna systems. The manual "search forever until the vswr drops to about 1:1" approach is capable of tuning a pop can to operate on 80m. The pop can won't hear or radiate very well, but your rig will see resonant antenna system. Beware that all of this can lead to very high levels of RF in the shack, since cables etc are radiating (as opposed as to behaving as shielded cable). This can cause a Yaesu (and probably other) rig to behave badly (not to mention that it's probably not great for you). It is possible to make an automatic antenna tuner which has the range of the typical manual tuner. The tuning time might be a bit long. I remember a recent discussion in some venue of a 'binary switched' tuner. Maybe someone knowledgeable on this could let us know of good sources of information. -Tom, KB7EFZ ps: sorry for the length of this post, it just kindof started going... -----Original Message----- From: William Mastop [mailto:wmastop@...] Sent: Sunday, September 12, 1999 5:01 PM To: FT100@onelist.com Subject: Re: [FT100] FT-100 and ATAS-100 on 75mtrs???? 1520. tuning for mars...

Yahoo group: FT100 (1998 — 2000)
Date: 1999-09-13 17:26:48 UTC
From: Walsh, Tom
Topic: 1520 Message: 1520

John-
The atas100 tuning is accomplished by use of an SWR indication, requiring that one transmit at about 10 watts. For broadcast band, I pick a ham band nearby and tune there. When the minimum SWR is found, then I can adjust manually "a bit" from that point based on whether the desired operating frequency is up or down from the tuning location.
For MARS use, if you have a MARS license, this should not be an issue at all. Just set the radio near to the desired transmit frequency and push the tune button. When I am joining a net, I go off frequency a few KC's to do this, the match point isn't so different as to be a problem.
Good luck, the performance should be similar to a base loaded resonant antenna of similar size, I think.

Tom:
The SGC I mentioned yesterday is a "binary switched" device. It does
however tune pretty fast and can tune just about anything to just about
anywhere, provided you give it enough antenna to tune (in my case 75 to 6
Meters into a 102" whip).

Tom & Charles, check out this AT11 tuner, it covers 160-6 meters. Its about the same size as the FT100. You can buy it assembled and tested or build it your self. Assembled/tested is about $230 US mailed from the supplier in Maryland.

All, I gotta tell ya about the AT-11. This is a great little microprocessor controlled unbalanced line tuner. I ran mine mobile for a year with the Alinco DX-70T -- the rig control head sat on the transmission hump, the radio body and the tuner out of the way under the seat.
Worked like a champ and have the mobile bugcatcher some needed extra bandwidth on 80M CW. All automatic "one button" operation.

I also used it outside in the yard, at the base of my home brewed 40M vertical. This ensured there was minimal loss due to high VSWR on the coaxial line, and helped me use the same antenna without readjustment within the extra CW subband and the high end of 40M SSB sub band. I put the DC power onto the coaxial line to run the tuner. DC worked great through 200+ feet of RG-8 cable, and having the tuner near the antenna base really cut the losses down. No leaks. Best of all, it provided some extra selectivity to the rx on the HF rig too.

Good stuff. Oh yea...buy the kit form for $189 -- it goes together smoothly and quickly, and is almost of heathkit quality. Good stuff.

I have to agree. I built my AT-11 2 years ago and it has to be the absolute best auto tuner on the market. I have spoken with the people who make and market the thing and it seems that within the next year the tuner will be reconfigured to be used as an auto tune mobile antenna system. The pricing will be very competitive as well. 73, Alek. VK6APK. At 02:41 PM 09/13/1999 -0700, you wrote: >From: Joe > >All, I gotta tell ya about the AT-11. Tom:
Didn't see the article. Don't read QST any more. Don't care to. It should however not be hard to build the hardware. The big effort however is in the firmware to drive the thing, but if someone has that available, should be a good project.
Have a boat, but waiting for the next one to put HF on it. Doing a ground system in a fresh water boat that doesn't look a lot like another radiator is bit of a problem. Also, the one I have now has twin 454 Crusaders (gas), which along with the loran and my fuel management computer produce quite a bit of HF noise. The new boat (going to take a close look at one next weekend) will be a diesel. Now that I drive a diesel vehicle I'm spoiled with the total lack of interference!

1529. DSP working??

Yahoo group: FT100 (1998 — 2000)
Date: 1999-09-14 10:05:47 UTC
From: Jim LeFevre
Topic: 1529 Message: 1529

I do really like this radio. But from day one, I have questioned the DSP. Since this was a feature I really was looking forward to using, I did a little research on DSP. No, I'm not an engineer, but the DSP in my radio does little more than that inexpensive MFJ audio interference filter! Maybe I'm not using it correctly. At a hamfest this last weekend, I purchased an external DSP called the ClearSpeech Speaker from NCT. THIS is what I expected out of my FT100 DSP. My only gripe is that there are no controls except on/off. But what a difference. On signals that are 4-5 s units above the noise floor, it completely eliminates the background noise with surprisingly little distortion to the SSB signal. Would someone comment: is this what my FT100 is supposed to be doing, and is it malfunctioning? I seem to recall others writing to this list praising the DSP. I don't know why, unless previous models were even less effective. The dealer's booth at the hamfest had a FT100, and a FT847 for demo purposes, and although I only had about a minute to play with the FT100, it seemed to work exactly like mine, and the effect of this external speaker is startling. Jim: If you haven't played with the DSP settings menus you should get in there and crank some of those values to see if it does more like what you're expecting. I've been using the JPS products (NIR-10 & NIR-12) for quite a while and frankly the DSP in the FT-100 isn't too bad. I also have a Timewave that I won at Dayton and a cheap Radio Shack model. My only dislikes with the FT-100 DSP is that the audio level isn't compensated so that DSP on/off results in a bit of a level shift for the desired signal. Also, the automatic notch function doesn't reject as deep as I'd like, but is certainly enough to copy signals comfortably with a carrier nearby. Considering that it's integrated with the radio and easy to use, I'd rate it pretty good. If you have a signal that's 4-5 S units above the noise, this DSP should be able to clear most of the noise with no problem. If it doesn't after playing with the DSP level settings, you may have a problem. Chuck - N8DNX On Tue, 14 Sep 1999, Jim LeFevre wrote: > From: Jim LeFevre > > I do really like this radio. I praise the DSP in the FT-100. IMHO it works as well or better than my Timewave DSP59+ and runs circles around the DSP in my FT-847.

Your new "external speaker" is doing a LOT of good for you.
The internal speakers in most ham rigs leave MUCH to be desired (Ten*Tec excluded). I could not hardly believe the improvement in the FT-847 with a simple external speaker.

You ARE aware of the different "levels" of DSP action in the FT-100 are you not?

From: Roger Buiten
Topic: 1529 Message: 1533

Hi, I'm Roger, W8OMB, in Ann Arbor, MI.
I have had my FT100 since Dayton, and it has worked perfectly. Regarding the DSP, I've noticed some improvement with the notch filter, but not overwhelming, which matches others observations. But I haven't figured out how to set the top and bottom frequencies to clear qrm and qrn. I'd appreciate some suggestions on typical settings for sideband operation.
Also, I'm trying to figure out what to do, if anything, about my antenna. I'm using the Pro Am whip antennas, separate for each band, on a trailer hitch mount, with extra strapping for ground. (I had lots of difficulty until I grounded both the rig under my seat and the trailer hitch; now that is taken care of, and I get reasonable SWR on the bands I work on (40, 20, 15). But I do not get the performance that others talk about. Some say that can talk to whomever they can hear, but I seem to be able to talk only to those whose S meter reading is at least 4 or 5 squares. I've made a few international contacts, and several contacts around the country, but they are all "I can hear you in there" type contacts rather than the kind of solid ones that many of you talk about. I can afford a ATAS, but it seems to offer less exposure (antenna length) than my 7 foot whips that are tuned to the band I'm working. And I don't mind changing the antenna when I change bands.
The noise limiter works great, doesn't it. I couldn't believe how quiet it became when I activated the NL.
Thanks, all of you, for the interesting interaction. I've been "listening" for a few months now, and feel that I understand the FT100 better as the result of reading the one list.
73, Roger

I have one and it runs just wonderfully! It is about the same height as the FT-100 but a couple of inches wider and deeper. It has a dual antenna switch on the front and easily handles all bands and frequencies using a Carolina Windom for an antenna.
It was on backorder for 2 months though! 73's de Ken W7OP

Roger: Quick question about your antenna installation. What type of vehicle is it? You want as much of the antenna out in the clear as possible so if it's something like a motor home, you're in trouble. Also, with a bumper hitch mount, you do need some additional ground straps from the frame or body direct to your antenna base. Use something like a big copper strap if you can. You may also want to do some extra bonding of vehicle body parts. Depending on the type of car (or whatever) you could end up with a bit of RF being coupled into various body panels and not only mess up the antenna tuning, but cause additional loss of signal. The Pro-Am antennas are OK, but I think the wire sizes and coil diameters are marginal. If you get a chance, borrow somebody's Husler antennas and do an A/B comparison. I'm sure you can find someone in Ann Arbor with some of them. I'd be interested in the results. BTW, I've spent a great deal of time in Ann Arbor (now in Petoskey) and my sister and Brother-in-law (Ralph KB8ZOY) currently live there. Was also a member of the ARROW club a long time ago. And yes, you should get better signal reports than just "I can hear you in there". Hi Chuck--I have adjusted the settings within the user menu, and have tried different settings for a day or two at a time so that my ears will get comfortable with the audio, but still feel unsatisfied. Are you adjusting the user menu, or the service menu? I haven't yet got into the service menu and don't know if there are any DSP settings available.

Charles, My vehicle is Chrysler minivan. I have the ground strap from the mount to the body of the van. No further reports of RF feedback or high SWR. None of my Ann Arbor ham friends have HF in the car, so I'm hurting for direct comparisons. That's what I was hoping to get from the rest of you. I hear Ralph's call once in a while, but I don't believe I met him. I've been in Ann Arbor since 1960, so perhaps we overlapped. My only time away since then was in 1962-63 when I worked for Collins Radio in Cedar Rapids, Iowa. Thanks for your comments. Others will be appreciated. Hi, in my ongoing decision process another variable has just come up. As you may remember I was comparing IC 706 to the, what I thought was a "TROUBLED" FT 100, well the FT 847 has caught my eye. Has anyone any experience with this radio, and how would it compare for mobile ops with the FT 100? The Yaesu website, obviously put together by a 5 year old, does not have much info as to compare the two. I realize, at least it appears, the 847 does not have a remote front panel option. I am wondering most about size comparison. As for freq coverage, they are practically the same. I think power out on vhf and uhf is higher on the 847 then the FT 100. What about any antenna options, does it work with any of the current mobile HF antennas available from Yaesu?

Jim/KB8UNU >>

I too noticed a drop in "af out" when the dsp is on, my solution was to add
in a cassette interface and pipe the audio into my factory stereo. It works
super! Makes up for the diff when the FT100 is in DSP mode.. Plus this
eliminates the need for a separate speaker getting kicked around in the car..
The DSP is pretty good but it does lack the "tweakability" that the NIR and
others have.
But for a factory unit its OK. I would guess that the DSP algorithms can
be altered by Yaesu since most DSP chips support upgradability and can be
flashed. I really dont think Yaesu sufficiently tested this radio in the
field because there was intense pressure to get the product to the masses. I
do give them a "thumbs up" on its features, agility and size. As with all
products we will hear some horror stories but I am sure they will work out in
the wash.. My only dilemma right now is rf, I tried a few things to no avail.
I do have a few more emails to go thru and to try those ideas. I also have an
FC-20 tuner on the way and I will try various antennas etc along the way..

Richy

I just made the choice of the FT 847 over an FT 100.
I will mostly use it at home, so the 847 was a pretty clear choice.
It is about the size of a Kenwood R5000 if you have ever seen one of those.
I had a hard time deciding, but the 847 is only 240.00 more now with the
200.00 off.
The FT847 has 4 antennas out, the 100 has two (And they are pigtails)
They both can use the FC 20 auto tuner and the ATAS-100 antenna
The FT100 can have an AM IF filter added, and has just about full Rx from SW
to 900 mc
The Ft847 does not have full Rx and does not have an AM IF filter option,
but it does allow a CW IF filter and an (2) SSB filter. (1 for Tx & 1 for
Tx)

I just love this FT847!
My guess is that both are Great Radios!

I own both. If I had to ONLY own ONE of these two rigs, it would be the
FT-100 - hands down, no questions.

BTW, the FT-847 is my main VHF/UHF "base" (boy, I hate that word) rig, but
NOT my main HF radio. That spot belongs to a 15 year old Ten*Tec Corsair.

Unfortunately, it's a long answer... the short answer is just my humble
opinion based on actually owning both rigs.

Well, since Paul didn't tell us his humble opinion... ...the reason there is discussion is that the rigs are about the same vintage with similar capabilities and prices... Other than that, there's lots of little differences. I own both and would pick the FT100 if I had to get by with one. -Tom, KB7EFZ -----Original Message----- From: Paul R. From: Bob (W1RAM)

Jim (Caperelli),

I looked at the FT-847, liked certain things about it, but could not accept the fact that it doesn't have VOX. I chose an FT-100 instead. Size and portability were major deciding factors for me, but I were looking for a stay-at-home rig right now I would not consider the 847 because of the VOX factor alone. Maybe I'm way too fussy but this is just one man's opinion.
Bob

1550. FT100 vs. FT847

Maybe it's because this is the FT100 list and not the FT847 list? :-)

I have an FT847 and am very seriously considering an FT100 for mobile use.
I can think of at least one reason to have the FT847 over the FT100 and that
is if you want to work satellites.

Someone mentioned that the lack of a VOX was a showstopper in his decision
not to get the FT847. I had a rig with a VOX and found that I never used it,
yet I too was disappointed that the FT847 was lacking it...and I'm still
wondering why it mattered.

I have several headsets with VOX for my FT50 and FT51. If I don't remember
to disable the VOX, I find myself inadvertently triggering the repeater when
I'm listening. It also causes one to fill in the blank spots between
thoughts with 'ahhhh' which is also annoying. If a VOX is really important,
you can add it as an accessory.

If you need a base rig, I think the FT847 makes more sense. An FT100 would
be a more compact mobile rig. Why not one of each? :-)

From: George Sereikas
Topic: 1550 Message: 1551

You know, it's an interesting discussion topic. I owned an FT-847 and then picked up the FT-100. I am astounded by the performance of the FT-100, particularly when one considers the small size. IMHO, the FT-100 overall is a better radio....unless you are going to get active in satellites. If satellites are your thing, then the FT-847 is the ONLY way to go.

For everyday HF work and for casual VHF/UHF work, I think that the FT-100 is the way to go....and it's cheaper too. The DSP and the Noise Blanker on the FT-100 are MUCH better than those provided on the FT-847 (They actually are VERY effective). there are more memories in the FT-100. VOX is not a big issue for me, but it amazes me that Yaesu failed to provide VOX on the 847, but they managed to find a place for it in the little FT-100!

So, that's my $.02

73,

George

1552. Re: FT100 vs. FT847

Yahoo group: FT100 (1998 — 2000)
Date: 1999-09-18 21:19:03 UTC
From: Michael Jones
Topic: 1550 Message: 1552

For VHF/UHF allmode and sattelite I use an FT-847 in the shack. I don't think there is a rig on the market that can beat it in those two areas combined. I also use it to monitor six meters while on HF.

For HF in the shack I use an FT-920. Superior HF/6m performance to the 847 in all aspects, especially strong adjacent signal detection, AGC, preamp, attenuation, layout and DSP. FYI that's a 'bone-stock' 920 compared to an 847 with Inrad filters.

For HF and VHF/UHF sideband mobile I use my FT-100 (which broke again last week :(I'll explain in a separate message) Antennas are ATAS-100 for HF and 4 M2 Loops for 2m/70cm sideband (2 each band) I don't use rig for FM repeater type work except extreme rare cases. I don't have any vertically polarized V/U antennas attached. FYI, the 847 was originally my mobile rig for these purposes. Noisblanker and DSP are far superior to the 847 and I have been nothing but happy (When the rig is working) Mine has been back 3 times for the PA problem. If it happens again, according to CA law, I get a brand new one.

An interesting note without going into too many details: the FT-100 has FAR more in common with the FT-920 then the FT-847. The 847 and the 100 share the same frequencies, and thats about it. All the menu setting and capabilities mirror the 920 and to many seem 'enhancements to the 847'. I entirely disagree. THe 100 is a 920 with VHF/UHF added and the antenna tuner removed.

For VHF/UHF FM mobile I use an FT-8100r. Originally I took it out when I got my FT-100 back in January but I couldn't stand not being able to monitor two freq's simultaneously. I also crossband ALOT

And, to be complete I use an FT-51r pedestrian mobile.

Anyone get the impression I like my Yaesu radios?

73 de KF6SWI
Mike

p.s. I finally got my callsign plates; they arrived while I was on the road last week. It took almost 3 months.

1553. My FT-100 bites the dust....again

Well folks, I'm temporarily off the air HF mobile. Last week while on my way to Santa Clara the main tuning knob fell off. So, I'll probably pilgramage to Cerritos monday morning to get it fixed. I have no idea jhow it came off...and in looking at it, I have no idea how it stayed ON in the first place. No set screws, no nothing. I may be totally wrong, but it appears to be held on by a spring. But, I'm no mechanically engineer so I'm not going to even ponder it any further. I was still able to tune the rig via up/down mic keys.

For those that are keeping track,
9D021594 3 replacement PAs and now an exploding main tuning knob

Michael thanks for your input on the 847. I have now made up my mind, and I am going to go with the 100 mobile. Thinking it over I guess I will also leave my Kenwood 733 Dual band in the car. I like to listen to as much as possible. I know, I am a total geek.

Paul thanks for the info on the hidden set screws. I will remember that if my knob ever falls off. Did you use a portable X-ray machine to find them? Ha Ha Ha Sometimes you just have to outsmart those design engineers to fix these things, or at least figure out how to disassemble it to look inside at all the cool stuff.

Thanks for the tip Paul. Although I hadn't given it very much thought, I knew there had to be something besides nano-elves holding the thing on. Didn't look under the rubber because there isn't the slightest hint of marring on the shaft. So, I'll get in there and crank that baby back on.

Many Thanks,
Mike

I know Dave, I'm a Genius.. I cant help it.. But I will pass along all of my ideas as they come to me :-)

Still trying to get the rf out of my ATAS system, tried the ferrites, grounding.. Still pulling my hair out.. Gonna put the FC 20 in line when it comes and try a whip to see if I can load that up. If so, I suspect a problem with the ATAS. I noticed it makes a chuffing noise when going up or down in the tunable area of 20 meters. maybe that the problem. Has anyone sent theirs back for tuning troubles? Does anyone experience noises other than the smooth tuning noise the motor makes? Mine is pretty quiet except when tuning around 20m.. Richy

1561. Microphone adapter - hidden in Remote kit!

Yahoo group: FT100 (1998 — 2000)
Date: 1999-09-19 19:23:02 UTC
From: Gerald
Topic: 1561 Message: 1561

I was looking into the old problem of using an existing boom mile with eight pin connector with the FT100 and its remote mounting kit.
The micropone lead joining piece (the bit that joins the standard microphone to the extension lead) actually has a small PCB inside with provision for an 8 pin mike connector and the little box has the hole covered with a piece of sticky plastic - easily removeable and replaceable.

There are only two problems.

1 I have not yet worked out which is the best of the 8 possible positions to mount the socket for compatibility with my Kenwood microphone system which must remain 733 compatible. (Cut the trackes to the connector and rewire?)

2 Where in the UK do I buy an 8 pin connector with pins at the rear for PCB mounting - wire ended ones are easy. The alternative to this one is to enlarge the PCB holes to wire tag sizes - but question 1 is more important.

The radio works well and this hidden extra was a rather pleasant surprise

Cheers

Check your local electronics stores, look for a cd player to cassette interface, it looks like an ordinary tape cassette with a wire coming out of it which you would plug into your FT100 via the earphone style jack, you may

oops, you may want to add a stereo to mono adapter if it only comes out of one side so you pump both sides with audio.. They are real common but remember to buy one that works with todays autoreverse decks since some will not work right causing the cassette deck to cycle sides.. Sony makes a nice one.. Remember to keep the audio low on the FT and the stereo to avoid ruining your speakers. Good Luck Richy

A 10-20db t-pad would help in reducing the levels also

If you get into the dash, you'll likely find a pigtail for an optional
cassette
deck, although I'm speaking from a Delco background. It's also where
neato-kean
graphic equalizers and similar doo-dahs attach. This is usually able to be
used
as an auxilliary input. I don't know the signal levels.

Ok here is another solution, a few aftermarket stereo makers make a module which plugs into the antenna coax which allows FM and AM to pass thru but will also inject a modulated FM signal into the stereo, its a mini transmitter which will inject the signal as a broadcast station on an obscure frequency of your choice. You can get one of those instead which will allow you to inject the FT100 audio into the modulator which will rebroadcast the signal as ie. 89.5 FM, your local stereo shop can steer you in the right direction. I wouldnt risk fooling around with line inputs unless you can determine the proper jacks as inputs. Most aftermarket systems are easier to identify by the rca jacks hanging from the unit but factory units are usually proprietary style jacks requiring the dealer info before hand. My Saturn has such inputs but you would be required to have the proper jacks to mate it since we all know that they in all probability do not supply standard RCA style at the tail end of the radio.. The modulator will allow you to tune the stereo to an FM station and input the FT 100's audio (or any other device) into the radios antenna system via the FM modulator. This is a common way to interface an aftermarket trunk mounted CD player into a car never designed to have one. A cable can be made or purchased to attenuate the AF signal that an FT 100 puts out to line level signal which the modulator is looking for, too much of a signal from the FT 100 will over modulate the unit requiring you to keep the FT 100 audio low without the attenuation but it will still be usable. Remember that you will have to supply the mono audio of the FT 100 to both line level inputs or both sides of the modulator inputs to get audio out of all of your speakers. Its rather simple but the stereo guy may think you are crazy, you can sub out the FT 100 and tell him you need your portable cassette or CD player in the car and this will make much more sense to him and you wont look crazy :-) Good Luck Richy

From: Bela W. Lindenfeld
Topic: 1572 Message: 1572

Ordered the Heil Adaptor and received same promptly. Took out previous RF problems and allows me to use the Heil Microphones (am using the dual 10 mobile) It works better than I could have hoped for and solves the "Y**** cheap mic. and cable problem. The price was so good and the work so professional that I didn't even consider a do it yourself project.
Bela de N8SHZ

Look for me as XE1/N8SHZ for the next couple of months mobile!

1573. FT100 AF stereo interfacing

Yahoo group: FT100 (1998 — 2000)
Date: 1999-09-23 00:45:23 UTC
From: Jack Kovar
Topic: 1573 Message: 1573

I would like take this discussion a bit farther!
Having some experience with Toyota, Geo, Mitsubishi and Subaru factory radios.
After digging into most of the radios I found a AUX input.
Most of the radios have a DIN plug in the back of the radio or a pigtail with DIN hanging off it.
To select the AUX input a switch on the front of the stereo like CD or AUX was common.
Some models with no front switches required one of the pins on the DIN plug to be grounded to path the audio input
into the radio.
They use a audio Mux chip to path the audio to the correct device.
If switching delay is quick on Mux chip, your Ft-100 squelch circuit can automate the switching from your stereo to your Ft-100.
Stereo blasting away and squelch breaks on the ft-100 and grounds mux switch, Audio switches from stereo to Hf rig.
This is really COOL ! Audio is loud and crisp!
I have wired Cellphones, HT's, Scanners,Cassette players, HF rigs, Alarm systems and microphones to Car
radios.
This subject can be carried much farther and I hope to get DIN pin descriptions for most common radios in todays autos.
Any stereo installers out there that can help me with DIN configurations for many radios?
If all else fails you can tap into the low level input on the volume control.
This will allow use of the Radios audio amp and it's volume control knob.
A shielded audio cable should be used to reduce noise induction.
The down fall of this method is radio and HF rig share audio amp and speaker at the sametime.
A bit of audio impedance mismatch and audio distortion should be expected.

I have used this method with many radios.
I would like to talk to someone that has experience in audio impedance matching and voltage levels common
in stereo world.
Words like low level input, 600ohms, 8-32 ohms, ground loops and methods of matching them for best audio fidelity
are areas of concern.
If someone out there has the talent needed to perfect this interfacing please contact me!
There are great advantages and safety in this system.

If I get the proper feedback and support I will take this farther!

Thanks,
Jack Kovar

While I haven't been following this thread too closely, I wonder if a simple cd/cassette adapter (the kind that takes the line level out from a portable cd player and sends it to a cassette sized unit that drops into the cassette of the stereo) has been considered?

Thats just what we were discussing, the cassette adapter for the Cassette
stereo combos and the tx style modulator which can be used with the ant jack
on any FM radio with or without a CD or Cassette. Incidently I modded my
cassette adapter to pass audio to both left and right channels internally
with a mono jack at the FT100 end. Just make sure that you use an autoreverse
compatable adapter if you should decide to use one in a newer car or late
model aftermarket system. The FT100 works flawlessly with this setup and its
awesome to be able to custom tailor the audio using my equalizer, fade and
balance controls. This more than makes up for the drop in rx audio when the
dsp is engaged. Good Luck Richy

Greetings to all. I am very happy to read all of your comments about the FT100. I am interested in getting one. Have used many mobile radios including the 706 mkII and wonder how this compares. Also have been mobile for 20 years and have lots of experience with lots of different antennas including bugcatchers. Have lots to add. Any comments on the ft100 vs the 706??????????? Thanks and looking forward to exchanging ideas and info.

At Dayton, several years ago, I picked up a small Koss FM Radio Frequency Transmitter, model RFT50-A. It was being sold in the flea market for about $15. It is small and plugs directly into the Cigarette lighter socket. It has three transmit ranges and a tuning control to tune through each range. The ranges are 88 - 92 MHz, 92 - 96 MHz and 96 - 100 MHz. It has two plugs -- one is to power a cassette or CD player (unused) and the other is a stereo audio input plug. With the proper mono to stereo adaptor, one can feed the FT-100 audio into this little transmitter, find a clear spot on the vehicle's FM radio, and tune the little transmitter until the FT-100 audio is heard. No other connections needed. It works well.

writes:

<< At Dayton, several years ago, I picked up a small Koss FM Radio Frequency
Transmitter, model RFT50-A. It was being sold in the flea market for about
$15. It is small and plugs directly into the Cigarette lighter socket. It
has three transmit ranges and a tuning control to tune through each range.
The ranges are 88 - 92 MHz, 92 - 96 MHz and 96 - 100 MHz. It has two plugs
-- one is to power an external cassette or CD player, and would be unused,
and the other is a stereo audio input plug. With the proper mono to stereo
adaptor, one can feed the FT-100 audio into this little transmitter, find a
clear spot on the vehicle's FM radio, and tune the little transmitter until
the FT-100 audio is heard. No other connections needed. It works well.

Jim, K9BDN >>

Jim,
I found a similar device sold by R Shack, the particular one they sold
kept coming back (evident by all of the open boxes they had). Any Idea where
the list members could find the Koss Version as it must be better than the RS
one.. Tnx Richy

Hi. Welcome to the list, I think I heard you talking to one of the guys
on this list a couple days ago on 20M.

Never used a MKII, but I fooled with the original 706. I think the only
comment most of us can make is that the 100 is a few years "newer" both in
the technology and the user interface than the 706. Frankly, I would
assume both perform pretty much the same.

Hello friends of the FT-100.
Which the Range it of frequency in reception of the FT-100 ?
Did I Read that he receives from 100Khz to 1GHz, is it true, does have some interruption ?
Does he receive FM Broadcast 88~108Mhz ??

Well here is another opinion re: the FT-100 vs. the IC-706. I have an FT-100 (about a month old) and I absolutely love it. I previously owned an IC-706 and later a IC-706 Mk II. They were both great radios and I never had any problems with either one. My guess is that you wouldn't go wrong with the latest 706 version either.

I think that the receiver on the FT-100 is outstanding and the Noise Blanker is fantastic.....much better than the one provided on the IC-706. It really WORKS and the blanking level is adjustable. The DSP is also extremely good. It seems much more usable than the one provided on the 706 MK II and is very effective. I also like the auto repeater offset provided on the FT-100 (I do believe that the 706 MK II G has this feature as well). You really can use the FT-100 as one radio in your car that will replace your duo-bander and your separate HF rig.

I don't particularly like the fact that Yaesu put the antenna connectors on the ends of "pigtails", but I guess that that was one way of keeping the radio so small. I don't think that it will be a problem if you are careful in how you handle the rig. The remote kit is fine. I thought that it would be a pain having 3 separate cables (as opposed to one on the IC-706), but frankly, it has worked out fine. It is actually handy being able to locate the speaker and the Microphone in separate locations...i.e., NOT connected to the faceplate of the radio.

The access to features via menus is MUCH more intuitive and much more user friendly in the FT-100. Not that the 706 wasn't workable, but I think that the FT-100 is planned out better.

Overall, I have no problem recommending the FT-100. I don't think you can go wrong with the 706 either, but in my opinion, I believe that the FT-100 has an edge over the IC-706.

I hope that this is of some help to prospective FT-100/IC-706 buyers.

I am not in any way associated with either ICOM or Yaesu.

George

I just went down to Best Buy and purchased a SOUND Feeder SF100 for $19.95 The unit has a short stereo plug and a cigarette lighter plug built in. It also has a 3, 4.5, and 9v output @500 ma to run some other device(i.e. cd player) I plugged it into the FT-100 and tuned in a clear freq. on the FM band and tuned the SF100 to that frequency. Bang !!! surround sound with all the volume you can stand. I also noted that it lights up the stereo indicator on the FM radio. I think that feature makes it a little easier to tune. I did install a snap on choke on the audio out line of the FT-100 . It works and solved a big problem for me !

Thanks Paul and George for your input. I have heard over and over again that the noise blanker in the ft100 was absolutely superb....I run a Navistar diesel whose Electronic Fuel Injector module totally obliterates 40m...(+20dB). That will be the acid test! Also I too was no overly impressed with the DSP in the 706 so I am looking forward to operating this new ft100 to see how it attenuates this pulse type noise. The only fear that I have is that it won't and I will be stuck with a radio that I cannot use on forty meters. Incidentally, my ft900 seems to do a fairly nice job on the noise so this increases my confidence level about the ft100. Hopefully, I won't be able to hear what I won't be able to hear! Thanks again.....73s Mike K8YOY

Hi ...

Didn`t someone test this nice radio on AMTOR,Pactor etc. ?

It?s really working quite nice here on Packet Radio both 1200bd(need deemphasis !) and 9k6 using the 9k6 demodulator output.

I have a problem here using the PR1200 output (fixed AF output) for AMTOR or PACTOR , because there seems to be a DC voltage from the SQL (its called MUTE in the schematics) on the PR1200 output jumping if you switch from TX to RX . Of course there is a 0.1u capacitor in the line but nevertheless this makes it impossible to get the first characters in the AMTOR/PACTOR in the "receive window" time slot .
Is this a fault in my transceiver or did the guys really put the SQL (doesnt matter if you switch from SQL to RF in the menue settings) signal (5V) on the R1200 line . Have a look on the schematics(PA-Unit) near J3007 Mute connected R1200 with a 15k resistor (D3504 and R3535 3.3k connected to Data GND).

I tried to come in contact with YAESU , they told me they will call back but did not receive an answer yet.

You may want to add a car stereo filtering device, this will go between
your battery connection and the radio. RS sells two really good ones Hi amp
(20 and 40 bucks) that may filter the dc line. I plan to add one myself since
most late model GM alts are very noisy. You can usually suspect its entering
the dc line if the noise is still present when the ant is removed. If you
still hear it strong, you have the rf noise entering thru the ant
connector... You can also try reorienting the antenna away from the cab
somehow to help cut the noise down.. Good luck.. Richy

I think like a lot of hams, you are confusing pulse noise (like out of
a spark plug) with wide band (RF) noise, like out of a computer or your
fuel module. The FT-100 noise blanker - well, ANY noise blanker, only
works on pulse noise, NOT what you are thinking about.

The NB in my FT-100 does little to filter the insane S9 wide band noise in
my 1997 Pontiac Grand Prix.

The DSP is the FT-100 works pretty well on wide band noise. THAT will be
your acid test.

I find that the NB in the FT-100 works wonders on the S9 noise from my fuel pump on my Ford Explorer. This noise comes in through the antenna and not the Power leads.

The NB on the Ft100 is good but when set past 8 it will severely distort on
strong or local signals. The noise I get from my wires can be attenuated but
not totally eliminated by the NB with degrading audio quality. I also
experience noise from the alt which cannot be eliminated thru the blanker.
The filter I added does just fine at eliminating noise on the dc line
relating to the alt.. The computer in the navistar most likely can be
filtered somewhat and the dc line can be cleaned up going to the Ft100 thru
the use of filtering, chokes etc.. Richy

1598. Noise Blanker

Yahoo group: FT100 (1998 — 2000)
Date: 1999-09-25 12:12:47 UTC
From: mhodas@xxxxxxxx.xxx.xxx
Topic: 1598 Message: 1598

Thank you all for your responses. My noise from the diesel injector system enters thru the antenna.....I have moved my antenna to the back of the vehicle to no avail. I have installed two chokes on the Injector control harness and that reduces the noise to S9 and I depend on the blanker to do the rest. I have disconnected the antenna from the radio and the noise totally disappears which tells me that it is coming in via the coax. As far as fuel pump noise in ANY Ford product, there is a TSB for a filter that the dealer will install under the terms of the warranty. I had it done on an Aerostar and it eliminated the fuel pump hash. I do not know if it is covered after the warranty has run out. Noise blankers are nice but they do distort the audio (the nature of the beast) but I have noticed and have talked to ICOM and Yaesu and noise blankers are generally designed for either pulse noise (like if the radio is designed for mobile use) or AC type noise (like if the radio is intended for base use). Usually they cannot be good with both!! So I continue to solicit comments on how anybody's FT100 does on any type of noise. I am thinking that a combination of noise blanker with DSP should do the job.....Comments???????
Thanks again....73 Mike K8YOY

Ok folks:
I kept reading all the great things about the FT-100 & decided to get
ne(along with my newly aquired FT-847).
I have been wanting a Mobile VHF/UHF rig and also a Rx/scanner capable of
Mil Air with all-mode.
So this was a perfict fit.
It arrived so I was able to use it this weekend (Rx only) I gota put up a
discone for it in my attic.
It seems to have a Great Rx ! I did a lot of listening to SW (UTE-Hams &
some of my favorite Tropical BC Dx)
Anyone have any tips for me as far as programing & listening?
Thanks in advance
My list of radios has gone down but it is a Great fit for what I want!

Well good luck to you, you will need it. I put the RF bead kit on my injectors and that help some of it. But I dont think that is the source of all the noise. Running a E14 cummings. I have been fighting this for years. The freq rate of the noise is so high that a NB cannot work on it. And since this is RF comming in through the antenna system a DC filter may take out Altenator whine but not this stuff. I dont see how a DSP can take out the hash since the noise is so wide banded. How can it tell the difference between hash and the desired siganl? All it can do is take out a little bit of all of it. By the way, I wrote letters to all the radio makers about how important a good NB is on 6 meter fm as well. They all shined me off except for Yaesu. To bad the FT100 NB does not work on 6 FM. So I still use commerical 6 FM gear in the cars. Besides the Motorola stuff is really nice equipment. Even if it is old.
Ok well good luck to you.

Charlie (and others in the know), does the FT-100 actually do a decent job of covering the 225-400 MHz AM air band (sensitivity-wise)? I'm considering getting an FT-100, but I was assuming that, like most Yaesu VHF/UHF rigs, the coverage of the military air band was poor.

From: Roger Buiten
Topic: 555 Message: 1605

I'm really enjoying my FT 100, but think I'm not being heard well enough. I'd like to consider the ATAS-100. I've read many of the recent comments about it. Does anyone have one mounted to a mini-van? If so, what mount is used? I'd like to use a trunk/hatchback type mount part way up the back door, which is of the hatchback style.

I'm currently using the Pro-amm whips on a trailer hitch mount, and feel like every contact is a struggle. Any ideas would be appreciated.

Thanks, Roger, W8OMB

The trailer hitch places the antenna somewhat poorly compared to a roof mount.
Your pro-am whips would work better on a 3 magnet (each 5" diameter) mount, also from pro-am, if memory serves.

On the ATAS, it will buy convenience (I used the single band whips prior to buying
the ATAS).

I mount my ATAS on my pickup and suburban identically - mag mounted. If this
doesn't seem too odd, I could describe it again, although the description should
be in the archives.

Hi,

I have a mini-van with the ATAS mounted on it and it works great. Worked a JA in Hiroshima mobile to mobile on 17M.

I used the Diamond K400. Initially I just connected it to the hatchback as you suggest. It worked fine. The only problem was everytime you open the hatchback the cable is in the way and you have to be careful again when you close it.

I finally modified the mount and mounted it directly to the van body between the body and the lip of the hatchback. I just screwed it into the van body with four self-tapping screws. The screw holes are actually sort of out of sight behind the hatchback when closed. That way if I decide to take it off I can just insert some flat black screws and no one will probably notice.

It is a great antenna and a great way to mount it.

Roger, I tested that antenna with a field strength meter along with a outbacker, hustler, hamstick, screwdriver, and bug catcher on 75m. My personal results were in this order from the worst to best- Pro am, outbacker, hustler,hamstick,screwdriver,and bugcatcher styles. The Pro Am really preformed poorly as I think you are finding out. There was a substantial jump from the hamstick to the screwdriver and bug catcher. Just thought I'd pass that on for what its worth.

From: mhodas@worldnet.att.net
Topic: 1609 Message: 1609

In response as to where to mount a mobile antenna:
My 20+ years of HF mobile experience has taught many lessons some the hard way.
Here is a summary:
I have used center loaded (hustler, hy-gain, bugcatcher, outbacker perth and hamsticks). Base loaded (bugcatcher) and toploaded (mobile mark). I have mounted them on the bumper, side of body and center of roof. A center loaded 12 foot bugcatcher (3" 8tpi) mounted on the bumper performs very nearly the same as an 8' center loaded (same coil) antenna on the roof. The conclusion is to run your 8' antenna on the roof if possible. The reason is that the higher you locate the base of the antenna, the more you reduce your groundlosses. My preference is an 8 footer on the roof as opposed to a similar 12 footer on the bumper.

Center loading is the overall choice as it is a good compromise as to the number of turns for the required inductance. Top loading has too much resistance as it requires much more inductance and thus lowers efficiency, base loading requires less turns but is not as good as a radiator because all of the current is at the base. You want to get the current up the stick! ATAS100 is for all intents and purposes a center loaded ant.

Wherever I have mounted my antenna, it worked best when the coil section was located above the roof line. Pure and simple. It also worked best when the coax was grounded to the body of the vehicle. Also, the bigger the vehicle, the bigger the signal. (more sheetmetal, better counterpoise). The body of the is also a radiator!
I have used a mag mount on the roof and found that for 80 and 160 meters, a braid to the roof was required. I simply
scrapped the paint on a 1/4 inch square and soldered a short braid to the sheetmetal. Was a tremendous improvement over just the Mag mount.
The mag mount without the soldered ground seemed ok on 40 and up.

Other extremely important requirements: 1. connect the power cable to the battery. I route mine in between the door and body, no holes to drill. 2. Ground the radio in the vehicle to the body (seat track bolt is wonderful). 3. Ground the antenna coax to the body at the base of the antenna. 4. Mount base of antenna as high on the vehicle as possible....roof is best. 5. Make sure that you provide 100% modulation on your signal....nothing worse than a s9 signal with poor readibility.

When I purchase my ft100 and companion atas ant, I WILL roof mount it and provide a solid rf ground. Then I know I will have superior results with it as many of you had. In the meantime, gud dx'ing to all of you in the mobile. 73s Mike K8YOY

PS. I have over 200 countries worked in the mobile in that 20 year time span.
I have never used an amplifier...no sense they hearing you and you can't hear them!
I no longer pursue DX but rather enjoy talking to others about what other?
HF Mobile Antennas!

Deb-
Did you conduct the test as a set of measurements spherically oriented about the antenna? The reason I ask is that the radiation angle of the antennas could be different.

I have used 102" CB whips, the ATAS 100, and the hamstick antennas. All worked just fine. I don't have a FS meter. In all cases, these were mag mounted to the center of the top of a large vehicle.

I think Roger is spending a lot of RF energy heating the back of the car instead of sending it out into the surrounding area. IMHO.

I attempted to do the modification that is referred to in the list, and in the files for the list- the directions (last part omitted) are as follows:

> >Remove front panel from radio and open rear cover of front panel.

No problems to this point.

> >
> >Locate and remove R6035 and 6036 on the display board.

Again, all went well. R6035 already removed when it was opened, and R6036 removed with tweezers and a low power soldering iron

> >
> >Reassemble and install the front panel on the radio.

No problems so far

> >
> >PRESS and HOLD (DWN) and (STEP) buttons while turning on the Power.
> > The
> >display will read "r on"

Above, the problems start. While holding down the dwn and step buttons, and turning on power, nothing displayed on the display other than the usual frequency.

> >SET dial frequency to 375.72727 MHz and then power off
> >PRESS and HOLD (DWN) and (STEP) buttons while turning on the Power.
> > The display will read "HF on

The above, and all of the following, never happened. It 's like r6036 was never removed. Nothing appears on the display.

I tried powering back off, and disconnecting the power to the unit to be sure. Then tried powering on as above, being holding down both the dwn and step keys, and keeping both held down while turning on the radio using the power button.
Anyone have any ideas on this? Some help would be greatly appreciated.
William

The unstated step is to perform a reset operation, which will cause
the rig to resample the configuration jumper you removed.
You will lose various settings when doing this, so you might want
to write things down before doing this.

Yes, after you perform a reset, then do the multiple button power on
sequence. The things lost seem to be memories, whether ARS is enabled,
and things like that. I cannot remember if I lost the contents of the
memory keyer (I was trying CW mobile at the time).
Anyway, nothing that cannot be reconstructed, but with 300+ memories,
it would be unfortunate not to mention it.
Take care,

Tom- stupid question #2, looking in the manual, I see there are two types of reset. Do I do the reset that does the customized menu settings (home+func+power) or the one that resets the vfo and memories but leaves the customized menu settings as set(dsp+lock+pwr), or both?

Thank you, thank you, thank you, to all of you for your comments. There seems to be a real thread of what is important here.
It seems like I picked the wrong antenna at Dayton. I had done a lot of searching for the right radio, but once I had it, I needed an antenna. Since I didn't have insight into the antenna, my Dutch roots prevailed, and I bought the cheapest. So, I plan to order the ATAS-100, and the K400 mount (which I will try to modify as suggested). Although the best mount would be on top, I couldn't drive in my neighborhood with the antenna up there (I'd trim all the trees in the area). So I'll try the hatchback mount on the minivan, and have it up as high as I dare for my area. But keeping the loading coil above the top of the vehicle is the goal.
Thanks again for all the comments.
Roger

Mike or Deb, (you really need to go to dejanews or something and get your own free account!)

How far away from the car was the receiver? I've read Kurt N. Sturba say that you need to be a couple wavelengths away from the transmitter to get accurate measurements. I don't know if that's true or not, just curious.

What you are saying, I think, is that the ATAS 100 is a pretty decent HF antenna, right?

I would sure like to see a comparison between the ATAS-100 and a regular full size screwdriver antenna to see how they compare. I really like my ATAS-100 but I suspect it falls short of the performance of a full size screwdriver.

Mike-
Wanted to know whether you measured outside a horizontal plane. The antenna approximates a point source, but not quite. The radiation is distributed vertically in addition to in azimuth. If you assess the antenna in a horizontal plane, you have a part (fairly small at these frequencies) of the near field picture.
As someone else mentioned, you should be a few wavelengths out from the source. This should be done in multiple planes intercepting an azimuthal ring at various locations, and inclined to the horizontal plane at various angles. This should approximate a sampled spherical surface with a radius of a few wavelengths.
I wasn't questioning whether you had uncontrolled variables like what you reference below, but rather whether we are accounting for all of the radiated energy. If the reflected power is low, and the ground resistance is similar, the radiated energy should be similar, unless I've missed a place for the energy to be used.
At VHF and UHF, the angle of departure or radiation (or inclination of the lobes) matter tremendously to the effectiveness of an antenna. At HF, this is much less an issue, unless the angle is so high that the ionospheric reflections are significantly reduced.

From working both the hamsticks and the ATAS, the ATAS is more convenient, and otherwise my results were similar. The CB whip was the worst, since it was not tuned (trimmed). (it also resulted in the greatest amount of wind noise in the cab, transmitted through the roof I think...).
Take care, and we all have differing priorities for convenience etc. I really like the convenience of the ATAS, but initially I liked the cost of the handful of hamsticks for the bands I wanted.

Tom, Mike here, Yes the antenna testing was done equally. Same car, same monting position, same radio and power, etc. Also was measured at four equal distances from and around the car. Thats why I did not go into detail on how I conducted it. Its just my own observation I thought I would share.

My non-scientific opinion is that the ATAS performs very poorly on VHF/UHF.
My approximate comparison is to a 1/4 wave spike on either band.

The BALCONY kit (Not ATTIC kit, hi hi) has counterpoise radials for 70cm, 2m
and 6m. It uses a wrought iron balcony railing as an HF counterpoise radial.
The railing mount is NOT included. A collar and 3 radials for $80 US. YUK!

I am in a similar situation without an attic or balcony, since I live in a
downstairs apartment.

Yes... that would be the installation of all factory modifications that pertain to that particular radio and it's serial number.

As a former solder-slinger for a national electronics company that will go unnamed, service bulletins are considered private documents and are generally not made public, although service manuals may be printed later that include "revision" schematics.

Whoever did the antenna test said that the "screwdriver" (and because he was talking about the ATAS on the FT-100 list, I assumed it was the ATAS screwdriver) came in second behind a bugcatcher in an RF shootout.

I can't appologize for someone else not making themselves clear. :-)

Regardless, my ATAS 100 performs quite well with contacts from my car to europe and asia on 20,15, and 10M. Unfortunately, the *&%^$&*%
1997 Pontiac Grand Prix has so much RF noise, 40M is almost worthless. But the lease is up in June next year so I'll be looking at non-GM cars for the next vehicle.

Oh, your email name is Deb Bilacic. If you do not identify yourself with a signature or some other manner, people will think you are your wife. It's not a big problem, but your wife may not like having her email address scanned and available to spammers. Just a free suggestion.

If you have a web browser, like Netscape or Microsoft IE, you can go to several sites, such as Dejanews, or Yahoo, and get your own free email account - that you can access through the web browser. They work very well.

1633. 70 cm Problem

Yahoo group: FT100 (1998 — 2000)
Date: 1999-10-02 10:34:32 UTC
From: Jack Herndon - WU4H
Topic: 1633 Message: 1633

I looks like the 70 cm portion of my FT100 may have bought the farm. I have an intermittent problem in which when Tx'ing on 70 cm my SWR icon will give me a big X. Usually I can make a couple of transmissions before the problem appears. I have swapped antennas, mounts and feedline and the problem still happens. FYI the unit is remote mounted under the back seat of of my Explorer and is bolted to the frame. All other bands function fine.

Has anyone else experienced this sort of problem on 70 cm? It looks like the rig may be taking a vacation to sunny California.

Thanks,

Jack - WU4H

I don't know if everyone else should, but I started out using just the atas-100 for both hf and vhf/uhf. I too found that the performance on vhf/uhf was poor. I added a gutter mount vhf/uhf, and have been much happier with the results on those bands.

From: William Mastop
Topic: 1596 Message: 1636

Has anyone played around with this to obtain a decent hf signal and reception? Like Darwin, I don't have a railing. The atas is mounted with the base kit on a copper pole driven 6 feet into the ground. I have not used it much, so can't say with any authority how it works, but my impression is not very well. On the car on the other hand, it works very well. Given some very tight space limitations, does anyone have ideas that might improve the performance on hf without a railing?

Sounds like the UHF final may have a cold solder joint. I dont know the
final arrangement but I would take a look at the block diagram and schematics
and hit the uhf final section with an iron before doing anything. Just call
Yaesu and see if its ok to check it yourself before checking it so you dont
void the warranty.. I am having a tuff time with 20 meters, almost impossible
to get a lo swr on 20 (usually 4 bars) This is with two diff mounts and coax
setups.. I tried several rf grounding procedures but its still hi and peaks
with modulation. I may try a small tuner in line to make the ant resonant on
a different section of the antenna to see if maybe the antenna is just not
tuning in the 20 meter coil region. By doing this I hope to fool the antenna
up or down away from the normal 20 meter tune location for the atas and see
if the problem goes away.. Tnx Richy

1642. Are You Selling ?

Yahoo group: FT100 (1998 — 2000)
Date: 1999-10-03 02:56:53 UTC
From: James J. Caperelli III
Topic: 1642 Message: 1642

Well I have asked many questions here and received a lot of help. All of the advice has helped me to decide it would be the FT-100 and not the FT-847 or IC-706 MKIIg. Well I had 1 thing to get out of the way first, and that was a complete new roof on the house. They just finished the roof last week and it took more $$ then I thought it would. Unless I wait a few more months and build up the reserves, I must now look used. If you are looking to sell just e-mail me privately. Looking for the FT-100, ATAS Antenna, and remote kit. Send your price and any information explaining present condition. I will consider all offers.

Also has anyone used the ATAS with the Diamond electric fold down antenna mount. Interested in any mods to mount and how well it works. I need to go this route or something similar if I want to continue putting the van in the garage at night. I run all magnet mounts now but do not desire to run HF on magnet mount. I have been reading the list though today and see it is being done by a few of you guys.

Also can someone explain why the XYL thinks a roof is more important then a new mobile rig? HA HA HA HA

From: dale brown
Topic: 1645 Message: 1645

I just returned from a business trip and talked to a fellow that sold Yaesu radios. He told me that the early problems with the FT-100 were caused by metal filings that were not removed during the machining step of the case. This may explain why there is not a correlation with serial number. I suppose at least one of the production employees was sloppy in cleaning the cases and those were the ones that had a problem. The filings rolling around in the radio could cause all kinds of symptoms, depending on where they shorted out. Dale KC2PZ

1646. FT100 Use as a Base Station

Date: 1999-10-04 00:08:17 UTC
From: vilbert@xxxxx.xxx
Topic: 1646 Message: 1646

Hi,

Just joined this reflector but I have been reading the messages for a while.
I have noticed that most of the subjects center around the use of the FT100
as a mobile rig and I suppose that is it's primary function. I have recently sold my
back-up base rig and am looking for a replacement that I can use as a back-up
to my Ten-Tec Omni 6 and go mobile, since I spend so much time in the car
for my work.

From everything I have read, it appears that the FT100 is a great mobile rig.
My question is the performance when being used as a base station.

Any opinions would be appreciated.

Thanks,

Jim

1647. ATAS-100 Attic Kit?

Yahoo group: FT100 (1998 — 2000)

From: howitser@xxxxxxx.xxx
Topic: 1647 Message: 1647

I saw mention of this, is there such a thing? I have my ATAS-100 inside my attic right now, and am
trying to work out some type of ground plane. I'm going to be ordering the ATBK-100 mount kit, but
was wondering if there was something else out there I could pick up to get all the bands to tune properly.

Thanks!

Jim, I have purchased a FT100 for a back up to my FT1000D, and for portable operation. I use a 4 square on 80 mtrs and the poor little FT100 has a hard time rejecting unwanted signals. This rig like other compact models (IC706/DX-70) lack in high quality IF filters and tend to use the cheaper method of audio filtering (DSP). I have used my FT100 in 3 multi contesting operations with ok sucsess. DSP is nice but requires to much fine tuning for contesting. Compact is nice but you can only manufacture a high quality crystal filter so small ! Im sure this rig makes a wonderful mobile but will not compare to your Omni 6. I will be using my FT100 in Zone 2 during the CQWW-SSB contest at the end of the month. Maybe after that I will have more in-put. 73's Carl VA2BY / VE3BY -----Original Message----- From: vilbert@... I attended the Ham Radio Convention at the Queen Mary on Saturday. I attended a seminar given by Bob Heil of Heil Sound. Of note, he has created a cable to plug into the microphone connector to allow us to replace the mike that comes with the FT-100 and use any mike cabled for a Yaesu radio. "Downside" is that you will not be able to use dtmf with any mike using the cable.

Contact them at http://www.heilsound.com if interested. I purchased mine at the convention from HRO.

Jim,

That's what I use as a base rig. It looks stupid sitting there beside the Emtron DX-2 Amplifier but it performs as well as the best of them.

Go for it mate.

73 de Alek,
VK6APK.

BTW, I just discovered mine has the 70cm problem as well. I got my mate to check his ft100 and yep, its broken as well.

Cheers.

I was driving home Saturday night and heard the California QSO party on 40 meters. I live in central Colorado. I worked about 20 or so stations on the drive home. I noted that I was able to work every station that I could hear and some of them were weak. I also was pleased that except for one or two it only took one call for them to come back to me. Up to now most of my HF has been on 17 or 15 meters with good results but I was impressed with the performance on 40.

Mark,

Thanks for the report of the ATAS-100 performance. I ordered one last week, with the Diamond K400 mount. What vehicle are you using, and how is the ATAS mounted? Any problem with wind resistance? Do you have any auxiliary support to hold the antenna upright? I sure hope I can get the kind of performance you're talking about.

Roger

A Ford Explorer.

> and how is the
> ATAS mounted?

I am using the Diamond hatch back lip mount. When I first installed the radio I mounted the antenna on the hatchback. I really did not like it this way. For one thing the antenna was lower then I wanted because of where the mount had to be put so the antenna would clear the roof when the hatchback was opened. I also did not like having the antenna come up each time I raised the hatch back and the flex in the coax and such. It seemed like too much of a strain on the mount and the hatchback.

What I ended up doing was mounting the diamond mount directly to the body. I used a piece of about 2.5 X 3.5 inch 1/8 inch plate and mounted it to the body in the space between the hatchback and the body. (no holes or screws in sight). I was able to mount it high so the ATAS coil would be well above the roof line. I then connected the diamond mount to the plate and drilled a couple of holes in it's mount so I could screw it directly to the plate and not have to depend on the tension mount of the set screws.

Doing this gave me a better swr on 40 than I had before.

> Any problem with wind resistance?

Non that I have noticed yet and I have done highway +++ speeds often.

> Do you have any auxiliary
> support to hold the antenna upright?

Just the extra screws to really hold the mount on.

> I sure hope I can get the kind of
> performance you're talking about.

I am really pleased with it. I am sure that a full sized screwdriver would out perform it but then I would not have the auto tune feature I have with this.

What does the resistor removal wide band mod do to the band segments? When you push the up button on standard units, it goes to the next ham band. Do the up buttons still go to the next ham band or do they go up one meg, or does the radio remember what the last frequency used in the segment was? Dale KC2PZ

The radio has a "general coverage" vfo present which appears between the two ham bands it is currently tuned between. If you tune it to the 800MHz PSB, it appears above 440. If you tune it to VHF-HI, in the 156 range, it appears between 440 and 144.

An impressive nice feature of the FT-100 was how little was affected by the modifications (other than opening up the tuning range.)

A really sweet little rig.

Carl,

Thanks for the input. So far you are the only input received. I agree that it would be hard to beat the OMNI 6 and I am really not anticipating that it would be a comparable rig. Probably as it does not compare favorably to your FT-1000D.

Just a couple questions. Were you running the rig in CW or SSB when in the contest situation? If in the CW mode, do you have either of the optional CW filters installed? If you have the CW filters, do you know the shape factors for them. I can not seem to find any data on them, or maybe I'm just not looking in the right places.

Anyone else out there use their FT100 in both mobile and base operation that could give me some insight on the performance?

Thanks,

Jim K3WU

I don't know if my last message made it to the list or not since I haven't seen it come back to me from the list.

I bought my FT-100 back in May. I was using a Kenwood TM-733A for VHF/UHF and a Uniden HR-2510 10-meter mobile in my 94 Ford Ranger. When the 94 Ranger was totalled in an accident I bought a 99 Ford Ranger and found it difficult to mount any radio equipment in the truck because of the dash lay out. Since I had money left over from the settlement I purchased the FT-100 because I read in QST that it had a better noise blanker than the IC-706MKII. I like the radio a lot but I'm having problems with it as a mobile radio... which may or may not be a fault of the radio. I installed the radio in the truck and only had VHF running while I was weighing HF antenna options. When the truck is running I get a constant 5 S-unit signal on the meter. No noise is heard in the FM mode but if you switch to AM or any other mode you can hear the obnoxious sound of the fuel pump. Once I got HF going I was disappointed to find that the noise problem was even worse. As some of the people on this list know, I've tried various methods for filtering out the noise from grounding the
radio and antenna better to adding capacitors across the power leads to the fuel
pump to having Ford install their noise filter on the pump. None of this worked.
Then one day, just for the heck of it, I pulled my HR-2510 out of the closet and
hooked it up to the same antenna and same power leads as the FT-100 and started the truck. With the 2510's noise blanker off I get the same noise as I hear on the FT-100. Turn the noise blanker on and the noise disappears. To test
this further, I put an Icom IC-2100H 2 meter mobile in the truck and hooked it up
and the 5 S-unit signal that I was receiving on the FT-100 was non-existent on the
2100.

I'd put the 2100 in the truck permanently but there isn't anyplace to mount it and I
REALLY want to do mobile HF. I've been playing around with the different settings

trying to find the right combination that might make the radio usable while the vehicle
is running. On SSB I've found that just turning the IPO on takes care of the noise.
Granted the signals drop too, but it's only about an S-unit and everyone is still workable.
If using AM on HF (or any band for that matter) as I sometimes do when listening to
shortwave or to some AM nets, I've found that switching the 2.5KHz filter on gets rid
of the noise but leaves the receiver too narrow to be useful. The noise blanker does
eliminate some of the noise but it causes the noise to sound choppy like the squelch
is cutting in and out and there's still a 5 S-unit signal level. If I turn the IPO on the noise
gets worse and I still haven't found a way to get rid of the signal level while using it on
2-meters.

I've been corresponding with Chip Margeli at Yaesu about this problem and the fact that a
$200 10-meter radio which is nothing more than an over glorified CB radio can eliminate the
noise entirely and yet the Yaesu can't. I'm going to be sending the unit to them on his
recommendation. It was his thought that perhaps there is something not quite aligned
correctly due to the problems I'm having since the noise blanker on the FT-100 is supposed
to quite good. If worse comes to worse, I'll purchase an FT-8100 and be content with
VHF/UHF mobile and use the FT-100 exclusively as a base station.

Just a couple of comments on using the FT100. These may fit in the "DUH" catagory but they are worth mentioning in case a user has overlooked them.

1. Noise blanker. Works great in mobile for reducing impulse noise so many people leave it on all the time. The way all blankers work makes them subject to overload on strong signals. That is strong signals away from where you are listening can activate the blanker and put what appears to be splatter or IMD on to the frequency you are receiving. If you hear splatter, check the noise blanker setting. BTW I have heard that the noise blanker really screws up strong AM signals. If your AM sounds distorted, check the blanker.

2. DSP. It is an audio DSP and the RF/IF agc can work against it. The manual suggests for best results to use the RF gain control to reduce the gain such that the agc is just activating. That is adjust the RF gain down so the fixed S-meter setting is just at where it was on the signal at full RF gain. Remember you have to switch the function of the front panel control from squelch to rf gain. It is in one of the menus, I don't remember which since I leave it in the Rf gain mode and don't operate FM.

My previous radio was a TS850 and I do miss being able to see the status of all the controls without having to go thru the menus. I think thats important in contest operation. Oh well can't have all that performance in such a tiny package without giving up something.

I guess I am like the little old lady who wants a small easy to carry bible with large easy to read print.

Bob

1663. ATAS100/Dodge Durango

Yahoo group: FT100 (1998 — 2000)
Date: 1999-10-05 13:40:24 UTC
From: Lee810@xxx.xxx
Topic: 1663 Message: 1663

I have an ATAS 100 that I got with my FT847 and was looking on my Durango for a suitable mounting location (this is in anticipation of getting an FT100, of course) and still be able to get it into my garage. I only have about a foot clearance between the vehicle's roof and the garage door opening. Currently, my little mag mount hits on the opening and flexes, so I can't imagine how I'd get the ATAS100 through it without some major interference. I was thinking that a bumper mount might get it low enough to only catch the tip of the antenna, but I was wondering how effective the antenna would be mounted low on the bumper like that. Any suggestions?

Thanks,

Lee Devlin, K?LEE

Hi Lee,

Any center loaded antenna like the ATAS100 will be very limited by not having the coil above the body of the vehicle. I would suggest you might want to try some type of fold over mount that will let you at least get the coil up when you are not in the garage.

Of course I wonder about putting a vehicle in the garage in the first place. Everyone knows that garages are meant to hold your power tools and not cars.

1665. FT-100 & ATAS-100

Yahoo group: FT100 (1998 — 2000)
Date: 1999-10-05 18:26:27 UTC
From: kc6vec@xxxxxxx.xxx
Topic: 1665 Message: 1665

Hello all,

I just wanted to share my experience so far with my new gear. I have had the FT-100 for about a month now and absolutely love it. The radio has proved it self on many contacts so far. I have used it inside the house on an R-5 vertical and have made many contacts. I primarily got the radio for mobile use and have since bought the remote mounting kit and just this week got the ATAS-100. Reading this group has helped me purchase the correct equipment for mobile installation. I got the Diamond K-400 mount and placed it on my rear left tail gate on my Toyota 4-Runner. I mounted the K-400 on the to left corner of the tail gate and ran the RG-316 through the bottom of the tail gate between the chassis and bed. There was a nice rubber knock out just under the spare tire to bring the coax back into the back cab of the truck. Everything has worked out fine as far as the placement of all the hardware. I just finished the remote mount kit last night and that turned out great too. The head is mounted on the center console just within fingers reach of all the controls. I have not decided yet as to were to locate the radio itself but am working on some easy access methods so I can take it inside when I need.

I am going on a camping trip to the desert this weekend so I will have the opportunity to use many features and test the antenna system more. So far the rig tunes the ATAS and SWR is always flat after tuning. I want to try the ATAS on the roof of the truck as well. I have an SO-239 on the top of the truck but not sure yet if it is mechanically strong enough to support the weight when mobile. I have several "Ham Stick" antennas that I am going to compare as well. My friend has the identical setup in his 4-Runner as well so we will be able to run many tests and comparisons side by side.

Thanks again for the list, it has provided me with some great info to get all of my this together.

73 for now!

David Griffith KC6VEC

David,
Thanks for the nice evaluation of the FT-100 and the ATAS-100. I also have a FT-100 which I love. It replaced a IC-706 MK II (and a IC-706 before that). The ICOMs were great, but the Ft-100 is MUCH better in my opinion. If nothing else, the Noise Blanker and the DSP are much better. I use it mobile in a Ford Explorer. I have been using Hamsticks on a Diamond K-400 mount on the rear tailgate and have been VERY pleased with the results.

I am particularly interested in your comparison of the ATAS-100 with the Hamsticks. Please be sure to let us know how you compare their performance to the ATAS-100. I am intrigued by the convenience of the ATAS-100, but am really curious how it's performance compares to the hamstick arrangement.

Thanks and 73,

George
KC2MF

1667. James' question - How's the FT-100 as an all around rig, not just mobile?

Yahoo group: FT100 (1998 — 2000)
Date: 1999-10-05 19:04:54 UTC
From: Walsh, Tom
Topic: 1667 Message: 1667

James-
Your comparison points (FT1000D and TenTec(?) Omni6) are pretty out of
the ordinary (ham budget). I can provide a comparison to my more affordably
priced gear. I have used FT-747 & FT-847 on HF. The FT-100 is superior. I
have the optional 500Hz CW filters in the FT-100 and FT-847. For those who
do not remember, the FT-747 was Yaesus' entry level solid state synthesized
rig about 10 years back. The FT-847 is superior in all respects to the
FT-747,
as expected. The FT-100 is easier to use and seems to be superior in
pulling
in the weak stations or those with interference, compared to the FT-847.
This
isn't a scientific comparison, naturally. I've used both of these with the
FC20,
a (manual tuner) BW-300, and mobile with the ATAS-100 and hamsticks.
On VHF/UHF, I've used the IC-251A (all mode), the FT-5200 and FT-8100 dual
band
mobiles, and the FT-530 and FT-727 H/T's, as well as the FT-847. Again, the
FT-100
appears superior in all-mode operation, and superior other than convenience
for
repeater / simplex FM operation. Naturally the bells and whistles of the
typical
dual band mobile FM rig are convenient. If you want cross band repeat with
time
out timers and automatic ID, you should get a mobile in addition. If you
can live
without these nifty gadget items, don't bother.
If you care a lot about working satellites, the FT-847 has important
advantages
over the FT-100. If not, I recommend the FT-100 as a capable all around rig
which
happens to be really small as well. Don't expect it to be the equal of a
no-holds-
barred $$ doesn't matter rig - but it will hold it's own against most other
rigs.
I have also had occasion to use a Kenwood TS-850 at the club station here
at work.
I have to say that it was an eye opener - the FT-100 was easily superior on
handling
interference. Maybe it was my lack of experience with the 850, but that rig
was a
real dissappointment.
On the topic of "I turn on the HR-2510 NB and it nocks down the S5 noise."
Remember

that some radios are built to be less controllable, and perhaps 'easier to use'. I bet
the HR-2510 puts an attenuator in line when the NB is engaged, in order to avoid the
effect of overload with the NB engaged.
FWIW, take care,
-Tom, KB7EFZ

From: James R Vilbert <vilbert@...>

Carl,

Thanks for the input. So far you are the only input received. I agree that it would be hard to beat the OMNI 6 and I am really not anticipating that it would be a comparable rig. Probably as it does not compare favorably to your FT-1000D.

Just a couple questions. Were you running the rig in CW or SSB when in the contest situation? If in the CW mode, do you have either of the optional CW filters installed? If you have the CW filters, do you know the shape factors for them. I can not seem to find any data on them, or maybe I'm just not looking in the right places.

Anyone else out there use their FT100 in both mobile and base operation that could give me some insight on the performance?

Thanks,

Jim K3WU

> Jim, I have purchased a FT100 for a back up to my FT1000D, and for portable operation. I use a 4 square on 80 mtrs and the poor little FT100 has a hard time rejecting unwanted signals. This rig like other compact models (IC706/DX-70) lack in high quality IF filters and tend to use the cheaper method of audio filtering (DSP).

1668. Stephen's HR-2510 comparison

Yahoo group: FT100 (1998 — 2000)
Date: 1999-10-05 19:10:48 UTC
From: Walsh, Tom
Topic: 1668 Message: 1668

Stephen-
While the HR0-2510 is a nice little rig (a friend had one last
sunspot cycle), you should consider that it probably knocks down
the RF gain automatically when the NB is engaged. It's already a
not spectacular RX, so it would be expected not to hear the noise
source in that case. I suggest you simply engage either the IPO
or the IPO+ATT when using the NB. An alternative is to set the
SQL control to be an RFGAIN control in SSB, and reduce the gain
that way. Also the S-Meter reading is showing true signal strength
rather than 'quieting', so it is expected to behave like that. It
in no way changes the RX behavior, it's simply a matter of display.
Take care, and sorry the 99 Ford makes so much noise. I think
someone mentioned a tech bulletin which indicated Ford was providing
a filter which went in the fuel pump power lead near the pump.
That would be more effective than anything you do near the battery,
radio, or alternator, as it would eliminate a long radiating wire
run as a source of the interference. Good luck, & 73,
-Tom, KB7EFZ

I don't know if my last message made it to the list or not since I haven't
seen it come back to me from the list.

I bought my FT-100 back in May. I was using a Kenwood TM-733A for
VHF/UHF and a Uniden HR-2510 10-meter mobile in my 94 Ford Ranger.
When the 94 Ranger was totalled in an accident I bought a 99 Ford
Ranger and found it difficult to mount any radio equipment in the truck
because of the dash lay out. Since I had money left over from the
settlement I purchased the FT-100 because I read in QST that it had a
better noise blanker than the IC-706MKII. I like the radio a lot but I'm
having problems with it as a mobile radio... which may or may not be a
fault of the radio. I installed the radio in the truck and only had VHF

running while I was weighing HF antenna options. When the truck is
running I get a constant 5 S-unit signal on the meter. No noise is heard
in the FM mode but if you switch to AM or any other mode you can hear
the obnoxious sound of the fuel pump. Once I got HF going I was
disappointed
to find that the noise problem was even worse. As some of the people on
this
list know, I've tried various methods for filtering out the noise from
grounding the
radio and antenna better to adding capacitors across the power leads to the
fuel
pump to having Ford install their noise filter on the pump. None of this
worked.
Then one day, just for the heck of it, I pulled my HR-2510 out of the
closet and
hooked it up to the same antenna and same power leads as the FT-100 and
started the truck. With the 2510's noise blanker off I get the same noise
as I
hear on the FT-100. Turn the noise blanker on and the noise
disappears. To test
this further, I put an Icom IC-2100H 2 meter mobile in the truck and hooked
it up
and the 5 S-unit signal that I was receiving on the FT-100 was non-existent
on the
2100.

I'd put the 2100 in the truck permanently but there isn't anyplace to mount
it and I
REALLY want to do mobile HF. I've been playing around with the different
settings
trying to find the right combination that might make the radio usable while
the vehicle
is running. On SSB I've found that just turning the IPO on takes care of
the noise.
Granted the signals drop too, but it's only about an S-unit and everyone is
still workable.
If using AM on HF (or any band for that matter) as I sometimes do when
listening to
shortwave or to some AM nets, I've found that switching the 2.5KHz filter
on gets rid
of the noise but leaves the receiver too narrow to be useful. The noise
blanker does
eliminate some of the noise but it causes the noise to sound choppy like
the squelch
is cutting in and out and there's still a 5 S-unit signal level. If I turn
the IPO on the noise
gets worse and I still haven't found a way to get rid of the signal level
while using it on
2-meters.

I've been corresponding with Chip Margeli at Yaesu about this problem and the fact that a
$200 10-meter radio which is nothing more than an over glorified CB radio can eliminate the
noise entirely and yet the Yaesu can't. I'm going to be sending the unit to them on his
recommendation. It was his thought that perhaps there is something not quite aligned
correctly due to the problems I'm having since the noise blanker on the FT-100 is supposed
to quite good. If worse comes to worse, I'll purchase an FT-8100 and be content with
VHF/UHF mobile and use the FT-100 exclusively as a base station.

Steve, N6TGK

Hi,

I have my ATAS mounted with the body below the roof line on my mini-van and it works great. I let the whip stick up above the vehicle. The whip on the ATAS is very flexible so it just bends to get in and out of garage.

The antenna works great I have been able to work Japan mobile to mobile on 17M with it. I have made more contacts with the Ft100 & the ATTAS in a few months than I made with my 706 and a variety of antennas over a couple of years.

From: Steve.Teegarden@xxxxxx.xxx
Topic: 1673 Message: 1673

Aloha All....
I have recently made alot of changes to my WEB site for the ATAS-100 and the FT-100.
http://www.frii.com/~cayman

IT now has a SWR Calculator, and a Wire Gauge calculator for current and load, all JAVA Based. There is now a rather humor filled story (Part -I) of the Installation of the Radio into a Ford Ranger Truck, using Gabmer Johnson mounting components and the GeoTool Stake Pocket Mount for the ATAS-100.

I have concluded my SWR curves analysis , and will providing SWR Curve charts for 10, 15, and 20 meters, as well as some other bands that had to be manual tuned. 40 Meters has not tuned at all on this setup, and even with the best of my intentions, and equipment, is still elusive.. :-)

I welcome comments, and other ideas, as well as request for more information, and so forth. I have received a few request so far for more pictures (I have a excellent Digital Camera and editing software :-) so if you want something graphics related say the word...

I have been reading with great interest other Amateurs results using the ATAS-100 and the FT-100 setup. It intrigues me that most of comments are about antenna mounting, and Radio functions... Has anyone else performed actual statistical analysis of the Performance ? Or SWR Curves ? Or Current demand / Loading requirements ?
(Just curious, so I don't re-invent the wheel, or is that re-invent the Radio ? :0)

Aloha for now....
Steve

I am sorry for the inaccurate posting of that software that runs many radios:

It is: http://ourworld/compuserve.com/homepages/f6dex

I had omitted the "s" in homepages. You can download a trial copy of this software and use it on kenwoods, icoms and yaesus. He originally developed it for Yaesu.

Please answer as I search the archives and get confused!

1. Best duplexer to use is _____.

2. Best to use ATAS 100 for all bands OR ATAS 100 and a separate vhf/uhf antenna?

3. When using only the ATAS100 for all bands, do you use the info from pages 14,15 of the manual or the info on page 62. There is a contridiction as to how to set Menu #61.

4. When using the ATAS100....What SWR do I expect on two meters?_____ 440_____?

Thanks for the info and I encourage all to download that soft ware. F6DEX give a free 30 day evaluation. It is called TRX Manager. It contains much more than just software to run your radio from your computer. You may very well be impressed. Tnx and 73 Mike K8YOY

I don't have the manual in front of me so all I can do is give you a clue. Look for info on group mode. I'm assuming it works while scanning. I do know it works using the up down keys on the mic to select memories. i.e. 50up1, 1dwn50 (or is that 49? I don't use this rig for FM except rarely)

Mike

1682. Fans Run Excessively?

Yahoo group: FT100 (1998 — 2000)
Date: 1999-10-07 00:35:27 UTC
From: jcoffman@xxx.xxx
Topic: 1682 Message: 1682

My FT-100 seems to run the fans when on HF/6 excessively. Switching
to VHF/UHF turns them off, but they come on again as soon as I
switch back to HF/6, even if I have transmitted on HF/6 for only
a few seconds. I would think they should turn off, after a few minutes,
similar to what happens on VHF/UHF. Is this the manner
the FT-100 is designed?
Thanks.

My FT100 will cycle the fans after a minor keyup and then slowly power them
down over a period of about 10 or so seconds.. Mine is a 9E serial number
indicating a March 99 build date. Maybe yours is a later serial number and
possibly if it doesnt behave like mine, Yaesu may have modified the logic to
keep the fans on in response to the PA failures that are occuring. Does
anyone have a 9F, 9G etc??

> Does anyone have a 9F, 9G etc??

I've had a 9F for about 2 months. I find the fans annoying. Using the FT100 on a DX cluster packet, the fans seem to come on even though PTT is active for less than a second (VHF/UHF)

On HF the fans will come on even if PTT has not been pressed ! Listening to broadcast bands the fans run the whole time !

Now the rig is getting older, the fans are getting noisier. It's impossible to listen to 6m without headphones. I don't use the rig on HF at all because I wanted a VHF/UHF multimode and this seemed the only way manufacturers would let me have one.

I DON'T WANT HF - why won't manufactures listen ? There's a market for VHF/UHF multimodes.

My fans only come on when the rig is keyed for a brief moment. Then they
follow the timing I mentioned. They will run continuous only when the tx is
up, they may idle while unkeyed but it is so quiet I havent noticed. The 9F
series may have been where they made this change (mine is 9E) to prevent
overheating. I will check mine out again today to get more of an Idea of how
the fan sequence is timed. You can check your sub command settings and let me
know what the fans are set for and we can compare notes to see if the
settings are soft or if Yaesu reburned their proms with the info.. I usually
run my rig under the specified outputs if I can and only run hi power when
needed. I am not really worried since I run the rig in the car and usually
always have good flow to the fans since the rig is not mounted to the vehicle
but faces the air vents which I leave on with cool air passing from them. Not
for long though.. Old man winter is upon us over here in the NE.. :-) Richy

PS>>> Below is a list of sub commands, I cant recall where I got em and
wish to credit the source but I guess there is no harm in putting it here for
others to use.. See Below epecially F48 and F49 which must be temp related..
Good Luck Richy

Second set of menu fuctions

Their is a second set of menu functions F01 to F59.
WARNING: changing these will reset all the memories.
I want to warn you do not change these values unless you are sure of what you
are doing.

To get them turn transceiver off. Press and hold the A,B,C keys; while
holding them in, press and hold in the [PWR] switch for 1/2 second to turn
the tranceiver On. Now let go of all keys. Then press and hold func key for
1/2 second to get to the menu and then rotate the select knob to get to a
second menu (F01 to F59) it's after #66 or before #01.
When you turn the rig off and back on it returns to normal menu.

Here is a list of the 59 second menu functions.

Function Setting in my radio
F01 144 RF GAIN 166

You bet it is. Press in the select key and hold it. ON the display, at the left, it will change from mch to gch. Then start scanning, and the scan will be restricted to the bank that you were in when you did this. To open the scan up again, press in the select key and hold it.

I am in the process of evaluating my FT-100 for Mil Air. (200 - 400 Mc)
I am using an Alinco DJ-X10 to compare.

It is taking some time, as around here, I only get activity in the daytime &
I work in the daytime. I am testing eve's but not herd much.

Last weekend I rec'd some activity, and it looks like it is not so sensitive
and may suffer from intermod also.
(But not much more intermod than my Alinco DJ-X10) (I did not expect the
preformance of an ICOM R8500 !)
It did not seem to stop on freq's that the Alinco did stop on. But it did
(If I stopped it on the freq) hear the signal.

I hope it gets to look better than the picture I see right now.
This weekend I will be using both with two Radio Shack Discone antennas in
my attic.
I will post my results Sunday night.

The fan/heat topic comes up from time to time. In August, Bob K6WFV characterized it as getting too hot on 440, and now it sounds like you are saying it's too cool on HF/6. Same thing, different perspectives.
To streamline things here, I'll just suggest interested folks go look up http://www.onelist.com/messages/FT100?archive=134. If anybody wants, I'll rehash the topic in a new posting.
Short summary: Your fans are working as intended. Operation is meant to depend on the effective frequency, with 70.5MHz the dividing line.
'Effective' because as someone pointed out, the frequency in a 'deleted' memory (showing blank on the display) gets applied to the fan control logic.
My opinion: this seems screwy, I don't think the box should be allowed to get so much hotter under some (VHF/UHF) conditions.

1696. FT-100 in Ford Ranger

Yahoo group: FT100 (1998 — 2000)
Date: 1999-10-08 00:21:31 UTC
From: Stephen Mitchell
Topic: 1696 Message: 1696

Hello everybody,

I just wanted to pass on some information regarding a problem I was having with my FT-100 and the noise generated by the fuel pump on my Ford Ranger. After trying various methods of trying to filter out the noise with no success I had just about given up hope of using the radio in a mobile application until I started looking at the "hidden menu" options. I printed out a list of my radio's default settings and started playing around with a few of them. Of most interest to me was the HF, 50, 144, and 440 RX IF GAIN settings. Now, I'm not an RF genius or anything and the steps I took certainly aren't what might be considered text book alignment. With the engine off I noted what signal levels various stations were coming in at. On HF I used WWV at 10 MHz and on VHF I used a local repeater which I receive with full quieting.
I also found a weak station on 10 meters that was in Missouri. He wasn't "moving" the meter but I could hear him. I then started the truck and went into the "hidden" menu. First I went to the 144 RX IF GAIN setting. The default setting is 108 on my radio and I also get 5 s-units of signal on the meter. I turned the setting down to 95 and the signal level was gone and the repeater dropped only a few s-units. I then went to the 144 RF GAIN and changed the setting until I got a peak in the 2-meter repeater I was using. Still no noise level and I was getting the repeater at or close to what I normally get it at. I did the same steps for HF and the default setting there is 98 and I get 6 - 7 s-units of noise on AM. I turned the HF RX IF GAIN down to 43 and the noise was barely perceptible. What's more, WWV and the station on 10 meters were still copyable. From there, I went to the s-meter
setting and turned the setting up until WWV was at the level it was before I started. So far, it's made a BIG difference in reception on all the bands. I'm
hoping to get the 6 KHz filter and install that and try turning the gain back up
a bit. I noticed that if I selected the 2.5 KHz filter the noise went away but left
the receiver too narrow for AM reception.

Anyone have any opinions on what I did?

Steve, N6TGK

It may be dependant on the antenna matching and quality. When I listen
to a band that the antenna is not tuned to, it has a rather low receive
volume.....Dale KC2PZ

I would be intrested in a technical evaluation of the methods described above and what effect it would have on the HF bands and what would happen to the sencitivity of the rig. I have some Noise that varries with engine load . The Noise also reduce when I remove my foot from the gas pedal and let the car coast. The noise goes away when I remove the antenna. My work car is a old Plymouth Reliant using Don Johnson's DK3 antenna(80-6meters). I know there is a eletric fuel pump and I have inatall a cap across the line and a ferite choke around the line to no avail. Some of the noise may be Ignition noise but I have grounding straps on every place that I can think of including the tail pipe, trunk , hood and engine block.. By reducing the rf gain and running the noise reduction and noise blanker the rigis much more useable the the old 706. Some of the suggestion that I seen here on the list have helped a lot. I have been able to work some Dx and check in to nets daily and even work my brother mobile to moble so I think over all the FT 100 is a great little rig.

Geez Steve - you killed the RX!!! No wonder you don't hear any noise
now. Some of the guys say they did not hear car noise with Alinco DX-70s
and HTX-100, but since they were DEAF compared to the FT-100, I never
doubted the folk's claims.

You have turned your FT-100 into an Alinco!

This should only be noticeable on AM, CW, SSB. The reason is when the antenna matches the front end you get more signal transfer and that includes the noise level. And so you can hear more noise. This is a trick that can be used to tune an antenna without having to transmit. You tune the antenna or antenna tuner for maximum noise and you are then close to resonance. It is too bad that you can't make the ATAS100 go up and down without transmitting. I think it would be a neat feature to have.

I often listen to the Air Force HF Global net on 11.175 and I can't really tune my ATAS100 to get the best reception for it.

When in a FM mode the IF stages have a much higher gain and multiply the noise level many more times so that even the internal noise of the receiver sounds like a roar. This is why FM receivers always have that loud hiss when not squelched.

It is probably not fuel pump noise which is usually at a constant rate and level whenever the engine is running.

What does the noise sound like? Is it a static pop? Or is it a whine? Static pop is probably the ignition. A whine is probably alternator.

> The Noise also reduce when I remove my foot from the gas pedal and let the

More than likely then it is ignition noise.

Good start. That probably has helped some. Listen to the noise. If it is ignition you can tell by the distinct pop that happens every time a spark plug fires. There are several things you can do to try and cure this. The first is to replace your spark plug cables with radio suppression type. Most modern cables are already of this type. You can also get suppression resistors that snap on between the spark plug and the spark plug cable. There is also a suppresser that will fit on the lead for the center conductor of the distributor. Check or have your distributor cap checked. A worn one can create a lot of noise. For severe cases you can even shield the spark plug leads.

If the noise is more of a static rushing noise it may not be ignition noise but static discharge from some other moving component under the hood. Check or replace the fan belt or alternator belt and see what happens.

It may be dependant on the antenna matching and quality. When I listen
to a band that the antenna is not tuned to, it has a rather low receive
volume.....Dale KC2PZ >>

In the 100-500MHz range, if you are referring to the S meter and not the
actual receiver, then YES, my FT100 also has lower-than-normal (or what we're
used to with std 2m/44 dualbander rigs) s-meter readings. But testing the
FT100 on my R2670 service monitor reveals the rx is actually pretty good.

On HF the meter seems to be on par with other HF rigs.

I know you can find a picture of it at <http://www.mods.dk/>. Looking at the back of the radio faceplate the resistors are in the upper left hand corner.

Hope this helps.

1706. ATAS-100 or FC-20

Yahoo group: FT100 (1998 — 2000)
Date: 1999-10-09 16:08:01 UTC
From: Stephen Mitchell
Topic: 1706 Message: 1706

Hello everybody,

I just installed the 6 KHz filter yesterday and it makes a much noticed improvement when listening to shortwave. Now I don't hear stations that are 20 - 30 KHz away and I was also able to turn the IF Gain back up about half way before the fuel pump noise started kicking in.

Anyway, the main reason for this post is to pose a question. Currently I'm using a Larsen dual-band antenna for 2m and 70cm mounted through the roof of the truck so using a single antenna for all bands is out of the question.
But for HF I'm using a 102" fiberglass whip which I can only use on 10 meters. So my question is: should I purchase the FC-20 antenna tuner as I planned or would it be better to get the ATAS-100? Either one would set me back close to the same amount but which one would be more efficient? I've heard that the ATAS-100 isn't any good on VHF/UHF but how is it on 6 meters?

Thanks,
N6TGK

1707. FT100 & Mil Air

Yahoo group: FT100 (1998 — 2000)
Date: 1999-10-09 18:43:05 UTC
From: W. Charles Alexander
Topic: 1707 Message: 1707

I have been trying to get a feel for the FT100 on MIl Air using my Alinco DJ-X10 as a comparesion Rx. So far it has been quiet here today for the frequencies I tried, with one exception.

On 344.6 Mc I rec'd a signal that my DJ-X10 stopped on a couple of times and it had a clear signal.
My little R2 with is's rubbber duck antenna, rec'd the signal fine also.
BUT the FT100 did not hear it at all! I stopped it on the channel that had 344.6 in it and opened the squelch . . . . nada no signal at all. 8 (

FYI the DJ-X10 and the FT-100 had Radio shack Discones on them (2 in the attaic)
More to follow as I try some more frequencies this weekend.

From: Roger Buiten
Topic: 555 Message: 1708

Well, gang, I've got my new ATAS-100 firmly mounted on the upper rear of my minivan, and it is working great. It is like the receiver came alive, and now I'm being heard when I call. My first couple of contacts included a good report from Sao Paulo, Brazil, and northern England on 15 meters, and a 10 over 9 report from Nebraska (from Michigan) on 20 meters. Many thanks to John and Mark for their encouragement, and for instructions of how to mount the K400C to the side panel of the door rather than to the door itself. The antenna tunes beautifully by itself, and as was suggested before, it gets a better SWR on 40 meters when mounted on the frame than when mounted on the door.

One question, tho. The book suggests that when you touch the TUN button to enable the antenna, TUN turns bold, like other menu items. Mine did not turn bold, even after several tries. But when I push TUN for over 1/2 second, it tunes just fine. Anybody else have that situation? Any suggestions?

I'm a happy camper with the FT-100 and the ATAS-100, and a dual band mag mount for V/UHF.

1709. FT100 FM Sensitivity - quick results

Yahoo group: FT100 (1998 — 2000)
Date: 1999-10-10 10:38:56 UTC
From: Gerald Gardner
Topic: 1709 Message: 1709

FT100 Sensitivity

Following the recent queries on FT100 sensitivity, I caaried out a few simple sensitivity tests which may be of general interest.
The set up used a good RF generator providing FM modulated at 1kHz with 1kHz deviation and then listening to the received audio for acceptable (!) to find the minimum RF level at which this occurred.
None of the gain or bandwith controls were touched throughout.

Hence this is only an approximately comparitive measurement and my ears need calibrating against a true signal/signal+noise reference before drawing conclusions on absolute sensitivities.

Anyway - I am broadly pleased with the FT100 and its ATAS antenna - even on a small car!

The results!
(MHz) (microvolts)
3.5 0.22
7 0.63
14 0.4
21 0.25
28 0.25
51 0.25
Antenna input change here
75 0.19
100 0.15
120 0.15
145 0.15
220 0.15
430 0.1
440 <0.1
600 0.95
700 9.5 (repeated!)
800 2.5
900 6
950 10
970 14

Comments / queries etc welcome - I will try with an audio power meter sometime!

Hello:

My ATAS-100 does not move up or down when I push the TUN botton of my FT-100. I checked the antenna connection and it had some water. Then I cleaned and dried the connection. When I pushed the TUN botton again, it sends the signal, the antenna motor works but the antenna does not move. Has anybody have this situation? Should I send it to YAESU or fix it myself? Does anybody have worked with this antenna?

Jose,

I've just sent my ATAS-100 back to Yaesu... this is the second time.
The first one was working great for approximately a month... then started to become intermittent... and then failed. (I replaced the mount, checked the FT-100 output, etc.)

Yaesu sent a replacement... which worked for less than a day... and it froze. Thinking it was my rig, I sent the FT100 in for service. It came back with a finding that there was a pinched wire. Fired it up... but the ATAS-100 still didn't work.

I'm sending the antenna back to Yaesu for another check.

Geoff

Just purchased an Ft-100/ATAS 100 and am wondering what trunk lid mounts are being used with success. I am looking at mounting the antenna on the side of the trunk lid, not in the center near the glass. The metal seems too flimsy at the center to support the weight. I wonder if anyone is using the hide-away type mount that flips the antenna into the trunk to secure it. BTW so far no fuel pump noise in the Audi A6q, just ignition pulse.

Mark,

I've used the Comet CQ5M, and the Diamond 400 for the side of the trunk mount. The former permits easy removal (ie. don't have to unscrew the antenna) for placement in the trunk.

I use the atas-100 for all bands. It, like many others, is mounted on the rear door of my van. The swr on 2 mtrs and 440 is about 1.3 to 1 (both bands). I have total success and have no need for two antennas. I encourage the same, as you do not have to be bothered with two antennas. I also use a Heil pro 5 head set with a foot switch and have hands free operation. I get "excellent audio" reports. Yaesu did in fact do it again! Best mobile radio I have used to date! Mike K8YOY

Mike,

How did you adapt the Heil Pro-5 to the FT-100? Heil sent me an adaptor with the 6-pin modular plug on one end (for the FT-100) and a standard 8-pin plug on the other. Did you use the standard Heil adaptor for Yaesu rigs in addition to the modular adaptor or did you make something up yourself?

I have seen something similar in my FT100 that I also have trunk mounted with the remote cables. However what I see is the display getting dim when I transmit and do not have the motor running to boost the battery to the regulated 13.8 VDC. I suspect in my case it is just low voltage as I have the original battery in an 89 car!! Is there any relay clicking noise as the display flashes?

Stephen-
Having used both setups, I recommend the ATAS.
On 6M, the ATAS is resonant, and works well as
compared to my other antennas, an end fed zepp
with a tuner and resonant ham-sticks.

Ciao Jim

With my set it happens when I have RFI with the power supply (the DC voltage moves up and down). My problem was due to the RF coming into the PS that I use for both the FT100 and the IC820H in presence of high SWR on the FT100; the two sets are connected to antennas located within 2 or 3 meters one from the other (a Comet CA-HV for the FT100 and a Diamond NR770H for the Icom). If I disconnect the DC cable from the IC820H, the DC output of my PS is a steady 13.8v.

I think this falls under the heading of, if you had not heard any good
rumors by the end of the day, you are suppost to start one.
I take it your club meeting was at night.

I just got my AES (www.aesham.com) flyer in the mail and they have the FT-100 listed for $1229.95 !!

That is a nice drop in price, so, what is up? New Yaesu FT-100 coming out soon ?

73

1731. Several Questions...

Yahoo group: FT100 (1998 — 2000)
Date: 1999-10-13 01:09:31 UTC
From: Ray Dabkowski
Topic: 1731 Message: 1731

Hello to the group... I usually lurk here and don't post very often. But time has come for a question or two:

1) Now that cooler weather has arrived, I've noticed the LCD display is acting sluggish on cold mornings. What can be expected when it gets *really* cold in a month or so. Will the LCD still function? Anyone from Duluth on here? Hi.

2) A recent posting showed that the rig is nearly deaf above 600MHz. (Thanks for the fine report!) I'd like to monitor public service in my area which is up around 850MHz. A friend, Bob/W8CBR, who is a regular here, suggested a preamp. Any advice on what type of setup I could use in the mobile to reliably receive these frequencies?

Thanks in advance,
73 de W8RD

P.S. Anyone see the FT-100 vs. Icom-706 showdown in the latest CQ VHF? No mention of the superior noise blanker in the Yaesu.

Well, living here in San Diego we don't get COLD weather very often or at
all when
compared to Duluth standards, at any rate, there was a time several years
ago when
I was using an HR-2510 from Uniden in my car and we had an unusual cold spell
where the temps in the inland valleys dropped to freezing by 8:00 PM. I
went out
to my car the next morning and when I changed frequencies the display
didn't change
AT ALL! But after being on for a minute or so it started changing again.

1735. First Impressions

Yahoo group: FT100 (1998 — 2000)
Date: 1999-10-13 23:36:29 UTC
From: vilbert@xxxxx.xxx
Topic: 283 Message: 1735

Based on the information I received from this reflector and extensive testing at the local HRO outlet
I purchased a new FT100. First I would like to thank all those who responded with their comments
on the FT100 performance. They really helped with my decision.

I utilized the new FT100 in conjunction with my existing OMNI 6 in last weekend's PAQSO party contest
and the following are my first impressions.

1. Purchased the 300 Hz cw filter with the rig. Not the easiest installation, not the least of reasons is that
I have been fighting (and losing) the battle to get bi-focal glasses. Soldering those connections is pretty tough
when you can't really see the points that well.

2. Set-up of the menus to my operating habits was easy and the manual was a help in those areas
that I was not familiar with.

3. Keyer is smooth!! Not quite as good as the OMNI, but very, very close. QSK is also very close to the
OMNI.

4. Solicited audio reports were also very favorable. Only used PTT.

5. On air operation in the PAQSO contest....WOW. I am really impressed with the receiver and overall rig.
Again, an OMNI, but very very good. Strong signal (and I mean S9+30db) was very good. The 300 HZ
filter is great for separating those close signals, sometimes almost too good. Simple to operate. Easily able to
have the computer key the rig. Did not try for computer control, since I could not purchase the CT-62 interface
cable. Seems HRO is out of them and they are on back-order.

I guess that overall, I am very pleased and impressed with the rig. This has got to be one of the best buys in
a new rig.

Can't wait to try it mobile, which will be a first for me. Looking forward to lots of QSOs with this rig.

For those of you who don't get on HF much, you could do alot worst than the FT100.

Thanks for patience in reading this.

Jim...be sure to get the ATAS-100 yaesu screwdriver antenna for the mobile work....it is a dream to change bands without hardly taking your eyes off the road. However, it is probably a good idea to use a separate dual band VHF/UHF antenna. The ATAS-100 is not very good on VHF/UHF...I have run the setup above for six months and have worked VK4, CT3, JA, G3, and many more...Dale KC2PZ/5

1738. Antenna and remote kit considerations.

Yahoo group: FT100 (1998 — 2000)
Date: 1999-10-14 03:15:20 UTC
From: James J. Caperelli III
Topic: 1738 Message: 1738

I see a lot of advice on the list about using a separate antenna for VHF/UHF, instead of utilizing the ATAS for everything. This is of course what I plan to do anyway.

Now I know that the FT-100 has 2 Pig tails, one being HF and 6M and the other 2M and 70CM. My question though is if you were going to use a single antenna would you have to purchase a duplexer or does the FT-100 allow you to program a single antenna "pig tail" to work on all bands? Or is it that the ATAS accepts two connections? I am just looking for some insight on the actual physical connections.

Also can someone explain to me the details on the remote kit. I hear some talk about a full 3 wire kit vs. ???

Yes, if you want to use a single antenna you must purchase a duplexer. The atas only has one RF input.

The remote kit comes with a mic extension, a speaker extension and a control head extension. Since each piece plugs into the 'main' section all 3 need to be extended. This being vs the Icom concept of everything plugging into the remote head (maybe some combination of the 2 as well) Personally, I prefer the 3 separate connections since for me all 3 pieces are going to separate places. The speaker is near my left ear above the seatbelt, the face is under the edge of the headliner just above eye level, the mic is at my right thigh. The rig itself is under the driver's seat.

73,
Mike

Is it just *me*... or does anyone else believe that their ATAS seems to work just fine on VHF/UHF??? I live on the other side of a hill from where I normally would lose a particular UHF repeater and the ATAS "loses" that repeater just the same as a BIG comet dual band colinear antenna did.

Perhaps not on VHF SSB/CW, but you need a horizontal loop (squa-lo) antenna to match the local's horizontal yagis on SSB anyways - not a vertical whip.

> other 2M and 70CM. My question though is if you were going to use a single
> antenna would you have to purchase a duplexer or...

You need a rather pricey duplexor (heh heh... I understand they are really supposed to be called a DIplexor). I use the Comet-706, which is really a TRIplexor. Can you believe that? A 706 is used with the FT-100! Comet should have renamed it.

> that repeater just the same as a BIG comet dual band colinear antenna did.

When I'm at work I'm about 50 miles clear line of sight from my 'normal' repeater. With a middle of the road Comet SBB5NMO to a Larsen (Centerloaded 42" I think) magmount it pegs the meter and has perfectly clear audio. With my M2 2m HO Loop (horizontally polarized) same as the comet vertical. ATAS100 fully retracted...fully extended...anywhere in between; about s8 on the meter and too much whitenoise to comfortably listen unless the noone is talking.

That same repeater (Hauser Peak, Southern CA 146.730) has a 30 year history of covering the mountain highways into Los Angeles about 50 miles to the southwest. If your on the freeway with an HT and rubber duck you can reliably make it about halfway; the atas looses it soon after. My same comet as above will go the whole distance (as will nearly any antenna I've every seen a local ham stick onto his car.)

Yet, on sideband with the ATAS (before I got the loops) I have talked from Edwards AFB to SanFernando mobile to mobile. The rig on the other end was a 706MkII to 2 phased loops running 160 watts with a 8db preamp. Is the ATAS somehow designed for the bottom of the band?

Well, My .25cents worth

I can't say I understand WHY? but thats some of my experience with it. FYI I absolutely LOVE it on HF. It seems to perform just as well as a 'fullsize' screwdriver; yet MUCH smaller. Not counting 80m of course...but then I don't really care for 80m.

Mike

Thanks to all for the information!

It has cleared up some questions in my mind. I do like the idea of the 3 cables. I just did not know if there were two types of remote kits out there or what.

David,

I might have a FT-100, ATAS100, and the remote kit as soon as this or next weekend. Working on a deal right now with a fellow ham right here in "9" land.

Of course I still have the FT-890 here in the house for some serious HF. Since the new roof on the house is been on for a couple of weeks, I think it is well seasoned and ready for some antennas to be mounted up there. So maybe before winter I should have two ways to work HF, mobile and base.

For those of you that want a real treat, try running the audio output of the FT`100 through a stereo to mono adapter and into a Cassette adapter for a cd player to your car cassette stereo. The audio quality through your 4 speaker stereo will blow your mind!! No need to put a speaker to your ear!!

Dan, W1PO

I do dis, mon, but not before I smoke de little number. Den it work real good.
I hear de band better, and tell de trut mon, my automatic antenna tuner what
froze in position -- well, it start to move up an don again, jus like before.
All dis in my 1972 F-100 wid de AM radio, one speaker, hooked to de audio o/p
of de FT-100. I tink now to get de 8 tracl. amd get even more blown mind.
Thanks for de tip mon!

Dan:
Yea! I'll second that. Actually I just installed a separate amplifier and speakers for the audio from my radios and NOW I can really hear things. The only problem I have is that receiving signals with PL can be annoying. I'll probably put in a high pass filter to clear that up.

1752. FT100 for sale $1050 shipped dead horse?

Yahoo group: FT100 (1998 — 2000)

Bruce!

To be fair to everyone else you should see if the warranty is transferable
to the second owner.
I do not think it is! Read your warranty and see.
You made it sound like this is a brand new radio, in fact it is 5 months
old and has been out of the box and used.
There have been many updates on this model noted by the little round
stickers added to the boxes.
MANY FAILURES!
Even if your radio works fine now, the warranty is not transferable then
someone gets stuck with a DEAD HORSE as soon as a failure develops.
I have been interested in purchasing one of the FT-100's. I have been
waiting until bugs are worked out.
The warranty issue disturbs me!
I too better pass on your radio if it has no warranty.

Yaesu warrants the original owner only. The warranty is not
transferable.

1754. ATAS-100

Yahoo group: FT100 (1998 — 2000)
Date: 1999-10-16 12:21:38 UTC
From: mhodas@worldnet.att.net
Topic: 555 Message: 1754

My ATAS-100 works great on all bands including 2 mtrs and 440. However, it makes squeaking and grinding noises as it traverses its mechanical range. I do not think this is normal. If not, how and with what do I oil the screw mechanism. Thanks in advance for your comments.

1755. CW ID wrong

Hi. I'd like to mention a story of good customer service and to ask if anyone else has seen this.

I have had my FT-100 a few months and am just starting to use it a bit. I programmed the CW ID function in ARTS and found that it makes a mistake! W comes out as di-di-dah just like a U. I checked the other characters and W is the only error. I called California and spoke to Mike. He asked my serial number, expressed that they had not heard of this problem, and told me he would check a few units.

Lo and behold, he called me back an hour later, confirmed the problem and said they called Tokyo (must have faxed since it was the middle of the night there!) and they're working on it.

Very nice response!

Anyone else run into the W error? Mine is a 9D series.

1757. New Owner

Yahoo group: FT100 (1998 — 2000)
Date: 1999-10-17 14:27:24 UTC
From: Dale L. Martin
Topic: 1757 Message: 1757

Late last week, I received my FT-100. Yesterday, after a day or two of recovery from reading the manual (wow! AND it's readable, too), I installed the radio in the car.

Nice radio. Very nice, indeed.

I've read the archives of this list and will go to Best Buy this morning and buy the RF link device. With this radio replacing my old Delta II, the keyer has gone away; now the speaker. A smaller set of paddles would be helpful, but my Brown Bros. can't be replaced.

When the remote kit arrives, that will pretty much minimize the presence of a radio in my car to a minimum. Now, the front passenger seat is occuppied. It's either the radio or a date, not both. Sometimes the radio wins.

The SWR meter had me fooled for a while. "The thin line below the PO bargraph" failed to register in my brain until this morning, when I did some more searching/playing around.

The keyer speed control is buried, but 30 wpm is a comfortable mobile speed and I can manually space for 'slower' speeds.

On reading the comments in the archives, it sounds like the ATAS is the way to go for maximum flexibility (great for Texas QSO Party/m band/mode hopping). Any reason I should not try it?

I'm looking forward to my next backpacking trip...heck, I'm looking forward to driving to the store!

Now. Has anyone interfaced this radio with a PC with contest logging software? Is the CAT interface unit the same as the MAX232 chip interface in the ARRL Handbook?

The band outputs consist of four lines: A, B, C, and D. Are they BCD (binary coded decimal = 0000, 0001, 0010, 0011, etc.) codes of the bands? (e.g., 160=0000, 20=0011, 17=0100, 10=0111, etc.)

Thanks for any info.

"It ain't so!" SSB steps for the VFO are 1.2, 2.5, 10, 25, 50, 100 Hz (yes
Hz). There
is also a "Channel Knob" that allows you to tune in 10 kHz steps in SSB
mode, but it
is designed for AM/FM and dialing up memories.

It's TRUE...

BUT...

That's for the "fast" tuning available through the selector knob. I
THINK even that is adjustable...

What you are really concerned with is the main tuning knob has steps that
can be set at 2.5 HERTZ, 5 Hz. 10HZ, 12.5... etc...

While driving, I'm pretty sure I find the 25Hz step the best in MY
situation.

Get the idea?

From: 2K-plus
Topic: 1763 Message: 1763

I'm in the process of moving my FT-100 (very early model with not a problem yet) from a Grand Cherokee to a 2000 Jeep Wrangler. On the Cherokee I used a 3 pad mag mount with great success but since that's not an option on the Wrangler I was wondering what type of side-body mounts have been successful with the ATAS-100. Any help would be appreciated and save me from having to experiment with different mounts.

Thanks,

It ISN'T so!

While the manual says the SELECT knob (the rotary encoder on the left) is channelized at 10KHz, the next line says if you press-n-hold the step button it changes to 1KHz. This is better for zooming around the band. Then you fine-adjust with the regular tuning knob.

Howdy:
I did the tape cassette connection to the FT-100 (also have the ATAS-100 mounted to minivan rear door frame), and got the same great results in the audio. I actually have ten speakers throughout the van. But..., I now get distorted transmit audio through the speakers that's bad enough to keep me from being able talk. Yes, I have the FT-100 grounded with a short ground strap to the chassis under a seat belt bold.
Anybody else have the problem? Or any suggestions?

Dan:
Yea! I'll second that. Actually I just installed a separate amplifier and speakers for the audio from my radios and NOW I can really hear things. The only problem I have is that receiving signals with PL can be annoying. I'll probably put in a high pass filter to clear that up.

1767. stereo interface problems

Yahoo group: FT100 (1998 — 2000)
Date: 1999-10-18 23:17:57 UTC
From: Jack Kovar
Topic: 1767 Message: 1767

A thought/ solution for your RF getting into the Stereo audio.
There is a Ignition sense circuit on your stereo.
This wire turns applies +12vdc to the stereo to turn it on.
It also turns off your radio when +12vdc is removed.
Take the TX relay signal out of the ft-100 and wire it to a Normal closed output relay.
This will switch the IGN SENSE wire open/off when the radio when transmitting .
It will also return stereo to normal mode when not transmitting.
I will be happy to help with any questions?

Measure the recovery time of the stereo to produce audio before you cut any wires by cycling IGN key.
If the delay is longer than your hopes, then Punt!

Jeez...

I was wondering when someone else was going to chime in on this. I've
been reading the posts about using the stereo amp to listen to the 100
with great interest.

It would be impossible on my car, a 1997 Pontiac Grand Prix.

You see, the same Delco/Delphi engineers that designed an automobile that
generates s9 noise on 40 meters, got together and designed a stereo system that
can't take a near-by RF field, like even the CBer in the car next to me on
the highway.

So I am humbled by you lucky dogs driving non-GM vehicles and enjoying the
FT-100 fully. Don't get me too wrong... I really love my Grand Prix.
It's actually the nicest/best car I've ever owned - except for the RF
problems - which unfortunately to an active ham, is a headache.

From: nx7u@xxxx.xxx
Topic: 1769 Message: 1769

Sorry to beat a (supposedly) dead horse...
Back in the olden days of this list (March-Apr) a fellow in NY had chapter-and-verse on the Ford TSB regarding the white filter to fix fuel pump noise.
My local Ford dealer is being a bit obtuse on the matter (his attitude seemed very much "don't bother me with things I don't know about").
Does anyone know the actual TSB# of the bulletin regarding the fuel pump filter?
I'm guessing from some research that it's 9637 but I need to be sure; if I give this guy the wrong # I'll *never* get it fixed!
Thanks in advance,

1770. Re: Antenna and remote kit considerations.

Sorry folks may be having problems with interfacing the FT100 with their car stereo.

I ran down to Best Buy and purchased the Sound Feeder, mobile audio connector--$19.95.

It works great on 20m CW--The only band I have tried it on so far. Back when I tried the faux-cassette audio feed method last year, the RFI from my HF radio on 20m and 40m CW was intense and rendered that method useless. I was happy to see the soundfeeder worked well. I haven't noticed any pumping of the audio or any other indication of RF effects through the stereo.

Soundfeeder does have a couple of downsides:
1. You need to either modify the audio connector for mono or add a mono plug-to-stereo jack adapter.
2. The audio connector cable is extremely short, putting the soundfeeder device (transmitter/voltage output level adjust unit) very close to the radio. A two or three foot long jumper cable might be appropriate.
3. Most? Many? All? cigar lighters are continuously powered, regardless of the ignition key/switch status. Thus, the soundfeeder is on all the time. Either put a switch in the cigar lighter line or pull the plug from the cigar lighter jack.

As as result of the above three issues I have with the unit and while I like the amplitude range the stereo lends to the HF radio's audio, I may well step back to a RS speaker at the front end of the center armrest.

The Stereo in my Saturn has an Aux input. According to Saturn, that's where the trunk-mounted CD player/changer would be connected to the Stereo. I could not get a schematic out of them, but I figure it's just a matter of time before I break down the techs at the local Saturn dealership or I discover the audio input connector/pin(s). That's where the HF radio audio might be placed. Anyone ever try that route?

73,
dale, kg5u

Without knowing the specific model and motor type I cannot verify the TSB#.
However, if you will check out www.alldata.com you will find a semi-complete
listing of all TSBs by year, make, model and engine type.

Hope this helps,

Barry W9MHM

Can someone provide me information about:

1. MMB-62, Mobile Remote Head Bracket. I cannot find anything that describes clearly the mobile remote head bracket. Can someone enlighten me as to it's physical size (height and width (same as the head, I imagine), depth (does it vary--deeper at the top, shallow at the bottom to give an upward slant to the head? Are there mounting holes/slots?

2. CT-62, CAT Interface Cable. What is the cable made up of? Does it interface directly to a PC with a DB25 or DB9? Is it just connectors and cable or are there passive/active components in it? Is it homebrewable?

3. YSK-100, Separation kit. I haven't seen a length given for the separation kit, although in a Saturn, there's not very far to go till you are out of the car. Still, what's the length? What is the "kit" comprised of? Does it take care of all cabling requirements--e.g., mic, remote head, speaker audio. Anything else? My assumption is that the "kit" remote head cable plugs into the remote head and that's all it is as far as the head is concerned: a connector. It's up the the MMB-62 to properly and securely mount the head to the vehicle and provide a fixed position for the cable as it mates with the head, right?

Thanks in advance for any info anyone can provide.

oops, big fingers!!

Does the problem occur with a regular audio tape playing or is it only with
the adapter? You can try ferrite beads (or cut one off of an old monitor
cable) and slip it thru the audio cable to try to strip off the rf if it is
entering thru the cassette audio cable. If not you should start using the
ferrites on the speakers closest to the antenna to see if it may be traveling
up the speaker connections. It may also be entering thru the dc line so some
work there may be needed. I have a factory Delco unit and I do hear a little
when I tx but its very low and not really enough to be a concern on my end..
Good Luck... Richy

<< The Stereo in my Saturn has an Aux input. According to Saturn, that's
where the trunk-mounted CD player/changer would be connected to the
Stereo. I could not get a schematic out of them, but I figure it's
just a matter of time before I break down the techs at the local
Saturn dealership or I discover the audio input connector/pin(s).
That's where the HF radio audio might be placed. Anyone ever try that
route?

73,
dale, kg5u >>

Dale,

You didnt mention what year Saturn you have. If its a 98 or newer, the
cable to the trunk is not installed at the factory unless the vehicle was
built with the Deluxe Cassette with EQ. I ordered my SL2 in 98 with a factory
deluxe AM/FM/CD in dash unit and the cable was not installed. Before the car
was delivered I had them change it to the Cassette version and add in the
trunk mounted CD player. The cable had to be added to this arrangement to
accomodate the trunk unit.
If you have a 97 or older Saturn with the EQ built in, the cable should be
there even if the cheaper stereo was originally ordered. The FT 100 can then
be trunk mounted and the audio can be piped right into this cable up to your
head unit. You could always use it right from the front and not use the cable
but this "way cool" setup would be too hard to resist in my book. Most
stereo shops can help you figure out which wires are which and how to trick
the Saturn deck into thinking a 12 disc changer is attached.
I will play around with my changer to see whats what and if I find
anything out I will post it to the group.. Regards.. Richy

1776. ATAS on 17M

Hello all,

When I first bought the FT100 and ATAS,
17 meters worked fine. I can be on 10m
or 20m and switch to 17m press tun and all
would be fine. Now, 4 months later, I have
to manually tune up and down to get a resonance
on any frequency in the 17 meter portion. I know that
the documentation explained this to be the case
but does anyone else experience this same phenomena or
the ATAS tunes fine all the time on your ft100.

Anyway, I'm very pleased with the rig.

KB1EDF,
Des

Hi,

I have noticed that the ATAS is seemly sensitive to how the feedline (coax) is routed.

I have my FT100 mounted in the back of my minivan. The feed line just runs out the side of the rear door. Sometimes if the coax shifts so it is near all metal as opposed to going out by the taillight it will tune erratically. If I reroute the coax it then will work fine. This doesnot seem to be an exact science sometimes takes a couple of tries to get it right.

Before, someone tells me to ground it better, it is very well ground directly to the van body.

1778. Car Stereo Audio and Remote Head Ops

Yahoo group: FT100 (1998 — 2000)
Date: 1999-10-21 17:05:22 UTC
From: Dale L. Martin
Topic: 1778 Message: 1778

Hi, fellow FT-100 users:

Just a little status report.

One week with the FT-100 and already I'm getting rid of equipment.

I tried the SoundFeeder (FM transmitter feeding FT-100 audio to the car stereo). It worked well. However, the two cables associated with it that I used (cigar lighter power and audio input cables) just added to the mess of having the radio in the front of the car. Besides, I actually liked the audio of the Radio Shack speaker sitting at the foot of the front of the center armrest. The stereo audio was just a bit more intense than I felt comfortable with--I know, I know. I could have run the fader forward and the balance to the left or right and been on only one speaker. But, that would require readjusting everything to listen to the good-time radio. So, the SoundFeeder is out. (anybody want it? $13 and I'll pay shipping! :-)

I purchased a remote kit earlier this week. I made up the missing cable (paddles! They did a speaker cable, why not paddles with it?), mounted the mounting bracket on a piece of plywood, put velcro hook pads on the bottom of the plywood, mounted the radio, ran the cables and hooked everything up. Works like a charm. That leaves only two remaining challenges: mount the head somewhere and figure out a way to place the paddles such that they are not in the passenger seat.

On the way to work this morning, I think I figured out what I want to do about the head: build a little stand that fits across and down the sides of the center console on which the head can be mounted, just aft of the gear shift and forward of the RS speaker.

But, what to do about the paddles....That's going to take more time. Brown Brothers paddles are not small.

Oh, the challenges of a small, but fun, car (98 Saturn SC2).

Jeez...

I was wondering when someone else was going to chime in on this. I've
been reading the posts about using the stereo amp to listen to the 100
with great interest.

It would be impossible on my car, a 1997 Pontiac Grand Prix.

You see, the same Delco/Delphi engineers that designed an automobile that
generates s9 noise on 40 meters, got together and designed a stereo system
that
can't take a near-by RF field, like even the CBer in the car next to me on
the highway.

So I am humbled by you lucky dogs driving non-GM vehicles and enjoying the
FT-100 fully. Don't get me too wrong... I really love my Grand Prix.
It's actually the nicest/best car I've ever owned - except for the RF
problems - which unfortunately to an active ham, is a headache.

Dale:
My two cents worth on placement of the control head is that you try to keep it up closer to your line of site while driving. I've had HF radios down on the console before and at least for me I find it too much of a pain and distraction to look that far down to see what the radio's doing. It wasn't so bad in the old days when there was a switch and a knob for everything and you just got to know where they were. Now, however, you have to actually read stuff on the radio while you work with it. Unless of course you memorize the sequence of menus an their associated functions. As for the key, don't most of the mobile CW guys use a velcro strap around their right leg with the key on there? You just have to remember to take if off when you get out of the car.

I am in and out of cars a LOT. My favorite remote-control head mounting spot is on the top of the windshield, straight ahead as I look out to drive. The eyes glance above the road for a second to look at the display, rather than avert down somewhere to see it. Sun glare is not a problem, and the visor can be tilted forward to completely hide it, even from parking attendants.

The only issue with the Yaesu is the head "nest" is designed to mount flat, without a swivel bracket so the head is inappropriately angled if the nest is velcroed (Radio Shack heavy-duty velcro is AMAZING) but I added a cell-phone clamshell bracket to make the right angle.

Jim,

Instead of fooling around with all these OEM connectors, I simply standardized on a Radio Shack 2-pin molex connector. It is a 20 amp connector and seems to work well with any of my HF, VHF/UHF rigs. I leave the OEM connector (male and female) in place but about six inches further I cut the line and install the RS male connector. All my power supply 12 VDC lines terminate with the female RS connector. They are a lot less expensive than the OEM connectors too.

Jim, K9BDN

I've done something similar, I have gone to 2 pin "Jones" connectors (also avilable at RS)...It has worked out nicely and makes it easy to move between car and shack. nevertheless, I would still love to find out if the Yaesu FT-100 power connector is available anywhere.

Exactamente, Jim! Been using them for years. They are Molex 1545's
or Radio Shack 274-222 connectors. They sure make life easy once you
have a few cords wired up.

ARRL has been pushing them as a 'standard' for 12v-dc power cord
connectors for mobile/fixed radios for a few years now. Check out the
ARRL Handbook for Radio Amateurs, section 22.6 or so (from my 1995
handbook). Think how cool it would be to walk up to your buddy's car
with your FT-100 and say something like "Hey, Bob! Unplug that
BandFuzz 101 and let me plug my Ft-100 in and show you how a real
radio works!"

Also, I apologize to all for the inadvertent 'broadcast' of my message
to Jim McGhee regarding the SoundFeeder. It's not that I'm ignorant
(well, not totally), it's just that I'm spoiled by reflectors that
DON'T reply to the reflector when one attempts to reply to the
originator. Please excuse the bandwidth.

Finally, I think I have found a place for the remote head which, while
below eye level, is easily reachable and won't take my eyes too far
from the windshield. I just have to do some whittling on a block of
wood to be the insert in the cup holder. Then, I'll mount the head to
that. We'll see...pictures on my website when I get it in place...no
matter how badly it looks!

the diamond mounts have the male end of the so-239 connector on them, but it has to be the long kind, no a short one, as the leverage of the antenna in full wind is considerable. They are around- check out any ham radio catalogue.

You must get a mount with the 239 as a connector, I use the cq5m mount but
there are others. The mount you are thinking of uses an NMO mount (ie. vhf
mobile style)or 3/8 thread style (ie. the outbacker uses this). The 239 style
is uncommon for mobile use but it is available. In a pinch you can use a
wilson magnet mount base to test it but dont drive with it or expect a good
rf ground but they are easy to locate and borrow for testing.. Richy

Hi All,

Does anyone knows if there is a way to transmitt on 70 MHz with FT 100 ?
Any information, comments appreciated.

Not that I want it or anything, but I've wondered that myself because there's a menu setting for 70MHz Power Out. I was hoping for a way to open up the six meter band a bit more to use with a transverter but I've had no luck so far.

From: Jory McIntosh
Topic: 1798 Message: 1798

I see that several people on the list are using the Comet RS-520 and several are using Dimond K400 mounts. I am wondering if it is worth the extra money to get the K400 or will the RS-520 work fine. I will be mounting the antenna on the back hatchback of a Ford Explorer.

Thanks for your help

Hi, Mike,
Mine attaches to the frame of the door in the upper lefthand corner, looking from the back of the minivan. I tried it in that general location, but on the hatchback door itself (for which the mount is made), but the SWR on 40 meters was higher that way, and the cable had to swing up and down with the mount when it was on the door, and the door was opened. So, at the advice of others on this list, I just turned it around to mount it on the door frame rather than on the door, and it solved both problems.

If you are going to try it, get the details of how to modify the mount from one of us who has done it. The advice I got made the job easy and quick.

1802. Software control of the FT-100

Yahoo group: FT100 (1998 — 2000)
Date: 1999-10-25 21:04:38 UTC
From: Jim McGhee
Topic: 1802 Message: 1802

Hi all,
I just got my FT-100 and I thought I'd like to write some control software for it.
When I first started looking at the protocol in the owners manual, I was very pleased at
all the information I have access to from the radio. I can even get the temp of the output
transistors! Cool.
But then I noticed that there is no way to set the radio to memory mode or query or
change the current memory number!
It seems silly to construct this rich a protocol and not provide any way to access
the memory mode. The main thing I wanted to do was to create an easy way to maintain the 300 memories.
Am I missing something? Does the shop manual list the rest of the protocol?
Any idea who to write to get more info on this?

Thanks in advance,
Jim McGhee N5FZT

1803. RE: Power connectors

Solution to odd power cords:

Cut cord
Add Anderson connectors to each end
Place Andersons in each area you wish to use the radio

Anderson connectors are polarized, easy to use, durable,
gangable, and work for me (and no, I don't sell them).

My local source is Wes Allen (K7WWG).

All of my radios get this treatment, saving lots of $$.
I use a 10 guage stranded wire. 12 guage is easier to
work with when applying these connectors.

Good luck,
-Tom Walsh

Jim-
Normally Yaesu rigs provide "clone" for the brute force 'backup/restore' type of operation. Would that meet your need? I've not gotten around to doing anything with the FT-100 yet, although I wrote some CAT software to use the FT-747 as a scanner during the Bush Bombings.

Hi Tom,
Its not so much that I am looking for software, as I am looking for the codes to access the memories so I can write some software.
Do you have any idea where to find the code to change to memory mode?
Or to change the current memory channel? Or write the vfo to memory?
Or maybe there's a 'dump memories' command thats used when cloning?

Thanks,
Jim McGhee

Hi,
Ok so the mount attaches to the frame did you have to drill holes or remove
any rubber to get it to fit. Do you have a picture of your setup I could see?
Also how does the ft-100 work on 2m & 6m ssb...how does it compare with a
hort polarzied antenna ? Does it work on 80M ?

No problem... I've found that the CQ5M mount permits the ATA100 to tune much better than the Diamond 400... especially on the higher frequency bands. (If I had to guess, it's partly related to the type of coax used by each mount.)

From: Dale L. Martin
Topic: 555 Message: 1811

I've never seen an ATAS100 in real life or much in the way of printed matter.

Can someone describe it for me, please?

How tall is it?

How thick is it (widest/narrowest diameters)?

I see references to the CQ5M mount. This is a Comit Trunk Lip Mount, right? Does the size of the ATAS-100 cause any distortion of the trunk lip?

How is the tuning of the antenna affected by the two different mounts? (CQ5M and K400).

Are there other mounts that are used/recommended?

I have a Hustler MO2 (54" break over mast) and Hustler resonators as my mobile HF antenna system. The MO2 mounts on a homebrew mount in a trailer hitch (http://www.hal-pc.org/~kg5u/mount.html).

My impression from comments I have seen is that no one is really mounting the ATAS-100 from a low point. Which leads me to believe it is a short antenna. Is that right?

If there are URL's featuring pictures/descriptions of the ATAS-100, I'd be happy to receive them and go look/read.

Thanks in advance for any info anyone can provide.

73,
dale, kg5u

1812. FT-100 Remote Head Mount

Yahoo group: FT100 (1998 — 2000)
Date: 1999-10-31 17:22:14 UTC
From: Dale L. Martin
Topic: 1812 Message: 1812

Last weekend, I mounted the FT-100 Remote Head.

There had been some discussion on the reflector in response to my inquiries about where to mount, how to mount, etc.

I own a 98 Saturn SC2. There's virtually no vertical flat/lightly curved, open surface area in arms reach of and facing the driver.

(Hey, Yaesu! Make a ROUND remote head--I'll mount it over the Tachometer--My SC2 is an automatic...what the heck is a Tach for?).

In cleaning out the car a bit, it occurred to me that the little trash bins (drink holders, actually, but they seem to collect coins, bits of paper, old receipts, etc.) Saturn provided at the right at the base of the radio/a-c/heating/cigar lighter console and just in front of the gear shift might be a good place to put the remote head.

On looking further and deciding that (1) I would have to remove the two hole insert and maybe build a mount to fit in the area, and (2) that I need at least one of those 'trash bins' in which to put my diet coke or water while driving, I decided to do this:

I took a piece of 4"x4", cut a 5" long piece. I then cut and filed to shape one end to fit in one of the drink holes (it's more a D shape than O shape). Once I got the insert end cut to shape and snugly fitting in the hole, I cut the top section so that it was angled directly at my eyes as I am driving. This means the radio remote head is turned about 45 degrees from car centerline and angled upward about 45 degrees.

I painted the wood block flat black (to match the plastic/vinyl interior color) and finished it with a couple of coats of finish/sealer.

I mounted the rear-mount assembly and now have been using it for a week.

It's a very comfortable position (granted, a more close to eye-level, direction of travel location would have been better, but, there's no such thing in this car.). I can glance down and, by feel and knowing 'where' my fingers are and 'where' the menu is, I can now 'move around' the menus a bit easier and I expect it will get easier as time goes on. My wrist/forearm can rest on the gear shift handle and my fingers can easily and comfortably tune around the band.

AND, a diet coke bottle, can, or bottle of water fits easily into the other drink hole without any interference from the radio.

I'll be shooting some pictures of it later today, I hope. I'll announce when I've got them on my homepage.

This is one neat little radio. The more I use it, the more impressed I am. There are some things I'd like to change (e.g., be able to organize the menu items to group together those used most often; faster CW speed change capability, etc.), but it's still a neat radio.

Dale,

To make life simpler next time, Visit a Cellular installation shop.

Ask them to show you a Pro-Fit bracket for your model car.

It is a custom designed mounting system for cell phones.

It mounts behind radio and migrates out between the bezel on the side of the radio.

Sits up high, No cutting or drilling.

Jack

1814. Re: ATAS-100

Yahoo group: FT100 (1998 — 2000)
Date: 1999-10-31 22:04:02 UTC
From: Geoffrey K. Hicks
Topic: 555 Message: 1814

Dale,

It's a nice-looking antenna... about 2 inches wide at the largest point (bellows)... when used with the Comet CQ5M (which is easily "removable") trunk lip mount, it tunes all the bands from 40 up...

The base is black (matte), and a stainless steel whip on top (specs below). I have mine mounted on the side of the trunk (Acura TL)... and have not experienced any problems with the fit. Considering the other options, this was the cleanest looking antenna... and it performs well... there hasn't been a station that I've heard that I couldn't contact with my 100 watt FT100. Great reports... usually 5-5 and up.

Good luck!

Geoff
KR4ZN

The Yaesu ATAS-100 is a unique mobile antenna designed for use with the FT-847 and FT-100 transceivers. It utilizes a motor tuning system which tunes the radiating element for lowest SWR. No tuner or separate whips are required. The ATAS-100 will mount on any suitable SO-239 type mobile base, like the Diamond K-400 or K-540.

Technical Specifications
band coverage..... 40,20,15,10,6,2m & 70cm
input impedance..... 50 Ohms
power handling..... 120 watts, SSB
typical VSWR..... 2:1 or less
length..... 1.4-1.6m
weight..... 2 pounds

Has anyone mounted the head on the visor on their car? I am looking at putting the head on the visor in my 1999 Trooper. Also has anyone hammed in a Trooper? Any hf noise to put up with?

Dale,

To make life simpler next time, Visit a Cellular installation shop.

Ask them to show you a Pro-Fit bracket for your model car.

It is a custom designed mounting system for cell phones.

It mounts behind radio and migrates out between the bezel on the side of the radio.

Sits up high, No cutting or drilling.

Jack

Anyone used an AT-11 mobile with an FT 100?
Does putting this automatic tuner inline exclude
use of 2 and/or 6 meters??(the antenna I'm
using presently is a Comet CA HV/with duplexer).

HF thru 6 is on one connector and 2m and 70cm on the other, the FC20 works ok but it precludes the use of the cat port for computer use if such operation is desired. I had the FC20 but ditched it for the the AT11 kit which is on the way. The FC20 must be activated by the tune button, the AT11 will tune in auto or semi auto and handles up to 150 watts and will cover 6m. The FC20 has a button on it for dual antennas allowing someone the use of two different antennas (a or b). The AT11 has no such provision but it can be added easily.
The FC20 can be mounted near the antenna but it goes only so far as it is limited by the length of the data cable supplied. The AT11 needs power and a coax run to it making for a simpler installation and it runs transparent to the FT 100. It will find a match for any band (160 is iffy) as soon as rf is applied to the tuner. There were some complaints of noise from the cpu chip so LDG incorporated a sleep mode which idles the processor once a match is found. The tuner can be awakened at the touch of a button but this mode is optional making for easier remote mounting if you desire..
I will post my results upon completion of the kit. I plan to mount it near the antenna in an aluminum enclosure with a remote pad up front containing the switches normally mounted on the front... Good Luck... Richy

Mine is mounted near the headvisor, but not on it. I attached to 1.5" L brackets to the head mount, splayed them open a bit and slid the ends into the edge of the headliner. The cable simply runs along the seam and down the side of the windshield. The tinted top section of the windshield keeps it invisible from outside. The only downside is that I can't see the face on the occasions that I actually need the visor; fortunately not too often.

Agreed. However I found it easier to use Radio Shack heavy duty clear
velcro to attach to the windshield way up top. Has stealth advantages when
the visar is deployed too.

Avid Reader of the FT-100 List

My FT-100 is serial #9F041848. It works perfectly!!! And I love the little Electronic Marvel by Yaesu. Use it with the ATAS-100 now want to split to the Diamond SG-7900 for VHF and UHF

Question (1) Can someone tell me how to access the Hidden Menus....Only because I want to record the Default settings.

Question (2) Which Diplexer is the best one out there??? As in low loss etc.??? Don't really want another set of Pigtails!?!?!?

I know these items have been discussed, I just haven't had to much luck finding the respones in the Search Mode at OneList. com

E-mail direct or on the list.

You don't need a diplexer to use a separate vhf/uhf antenna...just
connect the vhf/uhf antenna to the other coax lead. The diplexer is
when you want to use the ATAS-100 for all bands....Dale KC2PZ

1826. Adapt Yaesu MD-1 Mic to FT100

Hi Mike,

I am not sure I would say the best place is the cheapest place. I have found that the dealers that give you the lowest price are also the ones that give you no after sale support or service. Personally when buying high priced items, like a FT100, I will go for a local dealer who will give me support over a mail order dealer who you will never be able to meet face to face if you have a problem.

Mark,
I agree that going to a local dealer is usually the best unfortunately the nearest
dealer to me is R & L electronics in Hamilton, Ohio and I have had some problems with them in the past with new radios. They do not seem to care about the buyer once the radio is purchased. I may have to drive 5 hrs to Cleveland,Ohio
and go to AES.
I was hoping someone could give me advice as where to purchase the radio for the
best service as well as price since some of the radios have had some bugs in them.
Thanks Mike

I think it also goes to say that the FT-100 seems to sell for the same
thing, everywhere. So when you are coughing up $1300, $50 either way
isn't that big a deal.

I have admit, it really surprised me that AES was the company that had zero sympathy when my FT-100 died 24hrs after opening the box. My rig was one of the original 10 shiiped to AES Las Vegas. The manager flatout told me that he wouldn't do anything for me. He slightly changed his tune when I got nasty and mentioned disputing the CC charge. Even then he was still an absolute asshole. I had to jump his head all the way to the president in Wisconsin. He was excellent and went out of his way to help me. Though in the end he actually never followed through on anything he offered.

In the 90 days prior to having my FT-100 die I had purchased an FT-1000mp(for a friend oustside the US not me), FT-920, Quadra, FT-51r, FT-8100, FT-847, 70cm and 2m brick amplifiers, Kantronics KPC9612+, Garmin GPS3+ and many other more incidental type items. Now they will never get another penny from me.

Oh well, live and learn...

Mike

Sheeze, two R&L slams in a row... and I was going to recommend them!

My experience with R&L was that I ordered the separation kit and it
arrived at my office via UPS less than 24 hours later.

I also have bought something big (an HT or maybe my old FT-900) from them
at Dayton.

The best place NOT to buy the FT-100 is Texas Towers.
They may have a good price, but when your FT-100 goes bad, they don't want anything to do with the rig or you!
Won't stand behind a Dam thing.
Avoid the rip off, look else where.
I made the mistake of buying the FT-100 from them, I will never buy anything from them again.

Hi Mike,

Point taken.

Sometimes those of us who have local dealers forget that mail order is not always an option......
I have had good luck with HRO in Denver. I can't say how the other HROs are. The folks who run this one are carryovers from when it was another radio store and tend to give good service.

I've had my ft-100 for 10 days now and all i can say
what a great little radio. the only thing i would like
to know , does anyone now what all the icons on the LCD
display mean.
some are easy to figure out but the owners manual
makes no mention of their meanning.

Thanks

I believe the title of this thread should be "The best WAY to buy a FT-100"

I am confused when I hear everyone say the 'local' dealer will stand behind your purchase !

I ask the HRO people in Denver (which I happen to like) what does that mean ?

They said give or take 10 days !! That's not a lot !!

Sounds to me like we should be charging our FT100 purchases (or any high purchases) on our American Express cards !!

AMEX will stand in front of you the consumer and protect you a lot longer than that !! They will even take care of a "restocking" fee, if someone tries to charge you one.

Of course places like Texas Towers (which I have bought from before) won't take AMEX, but gee, I wonder why not ?

That may have been me--at least, I was in the conversation about them. I'm using the 274-222 and was under the impression they were rated at 20A. I see by both the Molex (model 1545) and the RS listings that 0.093" pins are only rated at 12A. The 274-151/-154 connectors are rated at 20A. The ARRL Handbook for Radio Amateurs says 25v @ 8A. It seems to me, then, that it would be better to simply connectorize the station and car with the heavy duty 274-151/-154 connectors instead of the 222. That way, a 100-watt HF radio can be part of the standard 12-v cable connectors in the shack and in the car. If it was me who said the 222's were rated at 20A, I apologize and stand corrected. 73, dale, kg5u -----Original Message----- From: Richard Newton To: FT100@onelist.com Date: Thursday, November 04, 1999 2:24 AM Subject: [FT100] DC Power connectors >From: "Richard Newton" > >In a previous mailing mention was made of using Radio Shack 274-222 being >a20A connector. From: Timothy H. Heaton
Topic: 1852 Message: 1852

Dear FT-100 owners:

I am considering buying an FT-100 and need to know if it has any special rating for the maximum SWR that it can handle. My HF inverted vees tune in the 2:1 to 2.5:1 range over much of the bands, and I wonder if this could be a serious problem. My old rig doesn't seem to mind, but then it has heat sinks as big as the FT-100. :-)

Thanks for the help. -Tim (WB7MNY)

From: Dale L. Martin
Topic: 1852 Message: 1853

Tim, There's little reason for a high SWR on an inverted vee. Can't you adjust it for better SWR? Do you have access to an MFJ-259 or other antenna analyzer? They are godsends when tuning antennas. You are talking about a $1100+ radio operating into a less than optimum system. Why risk it if it takes only a bit of effort to have it see <2:1 across the bands. Get out there before the snow starts falling!! :-) You will be happy you did. 73, dale, kg5u -----Original Message----- From: Timothy H. 1854. New FT-100 Owner and a quick Question.

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-06 23:12:28 UTC
From: James E. Watts
Topic: 1854 Message: 1854

Hello Everyone,

I'm new to the list as well as being a new FT-100 owner. I'm trying out the rig in the shack before I mount it in the mobile and I've run across a problem. I am trying to hook up the Amplifier via the ACC slot in the back. I used a 1/8" mini Stereo Plug, wiring it as TX-one down from the tip and GRND-to the base or 3rd down from the tip. Its not kicking in the rely of my Ameritron AL-80b. I was wondering, is there an internal switch or menu setting I have to enable to get the Line to short out on TX? I've looked and Looked in the manual and can't seem to find this. Any suggestions or am I missing something???

Thanks in advance,

James Watts,

Hi guys. I'm new to the ONElist and would like to find out how to get a copy of the icon list. Would be really interesting. I took my FT 100 on a 6000 mile road trip this last summer and had great sucess with the ATAS 100. I mounted the ATAS 100 on a "bike rack" the previous owner of my moterhome had put on the back end. It was eight feet off the ground. The moterhome is fiberglass. I used a duelbander for 2m & 70 cm. However now the 70 cm shows a hi swr icon whenever I try to transmit, even with the power down to 0%. Anyone know what this might be? Tom

Hi Jon,

The adapter is available but on back order, Heil expects to have a run
ready by the end of the month and it is available direct. Here in the US its
$24.99 plus shipping. I amin NY so it totals 26.99 with shipping. I sent them
an M/O Friday and I will wait for it to arrive when the run is available. You
can drop Heil and email and you will get a prompt and courteous reply
returned quickly. I would hazard a guess that it resembles the adapter for
the Icom 706 which you can see on their website.

info@... for email queries www.heilsound.com for the
site..

Good Luck and I expect to catch everyone while mobile with my FT100... Richy
:-)

From: Jfering@xxx.xxx
Topic: 1864 Message: 1864

I ordered and received one several weeks ago. I believe it is the AD-100. However, it must be used in conjunction with the standard Heil adaptor for Yaesu radios (AD-1-Y). In other words, you must use two adaptors to make it work with the FT-100. The new adaptor (AD-100) has the modular plug on one end and a standard eight pin mic plug on the other. It will work by itself with Yaesu mics that terminate with a standard eight pin mic connector.

If you are going to make one yourself, I believe you will have to install a 27 K resistor in the PTT line.

Personnaly, I had a Heil to KENWOOD adaptor and simply modified it for the standard Yaesu mic pinout. I then used it with the new Heil to FT-100 adaptor and it works like a charm.

I am not aware that Heil has an adaptor that directly couples the Heil headsets to the FT-100. If I am wrong, then I was mislead by Heil at the time I ordered and received the AD-100.

Jim, K9BDN

I've set myself up to make an adapter to handle all my mic/hdphone/spkr combos that I can dream up. One hitch to this is the mic element: the FT100 uses an electret mic that needs a bias voltage to supply a large enough signal to the radio. What are the parameters for using a dynamic mic, or a carbon mic (like the D104). I have a Yaesu desk mike, a MD1b8 which is dynamic, not electret. Has anyone used a dynamic mic element on their FT100, and did you have to attenuate, or otherwise transform the mic signal (or the impedance)? Obviously the dynamic mic is not using the 9vdc that is supplied to the handmic. I've looked for more info but just can't find it, and I'm sure that someone has already tried this. Yes? Jim kb8unu

1866. Well, is the "MKII" on the way?

Just curious, since AES has reduced the FT-100 to $1199.00 (Factory Coupon), could a new version be far behind? I figured the specials are to reduce the current inventories before the new radios hit the shelves. Anybody heard any rumors? Do I wait any longer?

1867. 40m SWR

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-09 04:09:16 UTC
From: Howard Breitbart
Topic: 1867 Message: 1867

I've had my FT-100 & ATAS-100 for about a month, with no problems, even with the ATAS inside my attic. Only difficulty is that I'm getting high swr when I try to transmit on 40 meters. The rig says it tunes the band, but when I try to transmit I get the high swr icon. Any ideas? I have the ATAS on a 19"x14" metal plate, with 18 gauge wire acting as radials. I'm using four 5' wires & four 10' radial wires. Do I just need to try to add longer wires, or is there a problem?

Tnx!

73,

Howard, N2JIH

I believe in the docs for the antenna is says that it's good for 7 mhz through to 50 mhz for hf bands. I think maybe you're out of luck.

Last time I looked 7 MHz was 40m. Oh and the ATAS tunes from 7 thru 440 MHz, manual states no tuning necessary for 144 and 440 just leave it in the shortest down position.

Sorry my last post wasn't a little more helpful. I too wanted to get on 40 and 80 metres, but the atas couldn't do it. I picked up a couple of hustler antennas, with the appropriate resonators, and mounted them to copper rods driven into the ground. Attached to the copper rod as a sort of a ground plan is metal screening, like what would be in an old style sliding door or screen door. I used two sections of 4 foot by 6 foot screening. It works well for 40 and 80. Not as well as a dipole hung in the air of course, but i just dont' have a place for that.

Sigh, that's what happens when one reads and replies to mail over the first cup of coffee- grin. My error, hope the original poster will interpret the foregoing two messages from the point of view of 80 metres- I must have really been asleep at the wheel- not only can't figure out a basic band plan, but getting the home setup and the car setup confused.

Hi Howard,

I have had some luck with that two ways:

1. Wrap 5 to 6 turns of the coax immediately after the rig thru a big ferrite "donut".
2. Auto Tune the 40m band the touch the setting up after the match by keying the mic and using the up down keys on the radio face to get the swr bars display to minimum.

The first suggestion was by a few people here who I thank very much. I still get a wacky swr on 20 once in a while, but the distortion on my signal is gone. My swr is good with the bird though.. Anyway, I also added a small ferrite to the mic line, I passed 4 turns thru a small ferrite there also. Good luck.. Richy

Howard...you may want to try a 2 to 3 inch diameter ferrite donut with
about three turns of coax wrapped through it near the base of your
ATAS-100...it may fix your high swr problem...Dale KC2PZ

1/4 wave length is about 33 feet.
Yes! much longer.

234/frequency in Mhz equal 1/4 length.

The wire does not need to be exactly strait out from antenna.

Jack

1877. AD-100-8 HEIL adapter for FT-100

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-10 01:19:40 UTC
From: Bob@xxxxxxxxx.xxx
Topic: 1877 Message: 1877

The FT-100 multiplexes the audio and control circuits onto one line feeding the modular plug, thus making it impossible to use other microphones or headsets. We were invited by Yaesu (since they weren't going to produce anything to do this) to come up with a proper adapter/decoupler. We announced this two months ago and because of tremendous response put our parts supply of the male adapter and the 8 pin modular plug in horrible back order, however that condition has now been rectified and shippments will begin within the next two weeks. On a recent trip to the Yaesu facility in Cerritos they felt we also should offer a headphone adapter also. Caution has to be applied in both of these cases as proper and VERY precice component tolerance must be applied.
Our normal AD-1 8 pin boomset adapter or our CC-1 7' microphone cable plugs directly in along with the FS-1 footswitch.

Contact your local amateur radio supplier or better yet, contact myself or Donna at HEIL SOUND...618-257-3000.

In all of the tests of the many rigs we see through our lab here, the FT-100 is quickly becoming one of my favorites. It is simply amazing how well this rig performs with the new studio GOLDLINE microphone. Hi-Fi SSB at it's best from this terrific combination.

I trust that this will help all of the FT-100 owners OR potential owners who are looking to operate the little 'jewel' with maximum SSB articulation using the Heil microhones and boomsets.

Thanks to all for your interest and your support....Keep amateur radio alive and share the wondermint and enjoyment to the rest of the world!

1878. 500 Hz CW Filter Installation

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-10 06:01:30 UTC
From: Dale L. Martin
Topic: 1878 Message: 1878

Following on the success of the remote head installation in the cup-holder and the rest-of-the-radio installation in the trunk, I ordered a 500 Hz CW filter for the radio. It arrived today. THEN I read the installation instructions. Geez. After some extreme breath holding, and extremely slow movements, the filter was installed and soldered in place.

Well, it wasn't a success. Something somewhere happened....something bad!

The 500 Hz filter seems to work fine. However, the 2.4kHz filter is not inoperative. Is this normal? It doesn't seem like it should be; I thought I would be able to switch between the two.

There is absolutely no power output. I can key the radio on CW just fine. Even the green LED turns red on transmit. However, there is zero power output indicaion on the PO meter scale.

I have re-opened the radio and reseated the connectors and the coaxial cables. Nothing.

Be forewarned anyone who may think about doing a filter installation: Think twice about it, read the instructions, and even open up the radio and see what you are facing. If you have the least doubt, either find a professional technician or send it to Yaesu and let them do it.

So much for a radio on my trip this weekend.

Any suggestions/recommendations?

73,
Dale Martin, KG5U

1880. Re: Heil Adapter for FT100

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-10 13:14:58 UTC
From: g0dvj@amsat.org
Topic: 1880 Message: 1880

Thanks to all who replied (via list or email) about this.

I was interested to understand that the adapter only addresses the mic input rather than the headphone output. This is exactly what I need since I feed the output of my FT100 (and FT847) into an SP8 speaker unit which has standard headphone output jacks already for use with my Heil ProMicro headset!

I will wait a bit to see if the adapter appears in our local UK Heil product retailers here and if not, order direct from HeilSound.

Thanks again for your contributions,
73,
Jonathan G0DVJ

1881. Antenna for a Ford Expedition

There are two ways you can handle this:

1) Don't buy the radio until you get the upgrade (we call
this the "incentive plan").

2) Get the radio and enjoy being taunted by all that HF
activity you can't work...

In any case, you -can- mount it on top. Mine is on top
of my 4runner, which is nearly as tall as your expedition
(I have the 'large wheel' option).

Just be prepared to develop a STRONG aversion to parking
structures!

Until you DO get your general, consider working 6m. The
openings are kinda sparse, but they are GREAT fun when
they do happen!

Oh and in regards to listening to 'live' CW while driving,
you'll probably do better listening to code practice at
known speeds. On-air stuff will get you ready for 'real
life', but think of it as 'casual listening' as far as
getting to your goal...

73 and good luck! - j

Mark:
I think you should get the radio and spend 1/30th the cost of your Expedition to get an SGC tuner (or less for one of the kit tuners) and a CB whip with a ball mount. Mount the ball mount fairly high for best operation--I'm sure you can find some steel on that beast to bolt it to. That way you can tune anything from 80 to 6 Meters in a flash and go through any parking structure you want (provided the banging of the steel whip on the parking lot beams doesn't bother you).

1887. FT-100 Questions

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-10 17:30:37 UTC
From: Timothy H. Heaton
Topic: 1887 Message: 1887

I am seriously considering getting an FT-100 as a "Christmas present" since my old Heathkit has severe limitations on features and signal quality. Could owners of the FT-100 answer a few questions for me:

1) What are the features of the FT-100's built-in electronic keyer? Can any type of pabbles simply be plugged into the unit for sending CW? How many characters (or strings of characters) can be stored?

2) Does the FT-100 come with a built-in speaker, or does an external speaker or headphones need to be purchased separately?

3) What does the speech processor do? How is it adjusted?

4) Why are so many of you buying different microphones than the one supplied with the FT-100? Is it deficient in some way?

5) What hardware and software is needed to send/recieve packet with the FT-100? (I have never used packet but have a Windows notebook PC.)

Thanks in advance for any responses. -Tim (WB7NMY) South Dakota

Mark

My suggestion for an antenna is:
1. For best performance, but structurally obtrusive (it is not a wife pleaser): High Sierra
2. For best trade-off between performance, appearance, and convenience: Yaesu ATAS-100. It's about 5 1/2 ft high, plus or minus, depending on which band it is tuned to.

My suggestion for your license situation:
Put a priority on learning the code, and get you general class license soon so you can enjoy the gem of the FT-100.

That's my two cents.

Roger - W8OMB

Hi folks

I just received my new FT100 from AES. It was in stock and took only 3 days to arrive. Everything works and I have made a few contacts with it on several bands. I have already made the mod and plotted the output vs. frequency. I will post the files here. I have several questions:

1. Is there a way to increase the output at the edge of the "expanded" bands? The output power on the 2M and 440 bands rolls off to nothing quickly. The HF bands seem ok.

2. What is the best way to use all of those memories? Any ideas on grouping? Is there anyway to download this info?

3. What happened to http://www.yaesu.com ? I get a "host not found" error message.

I am currently using the radio inside, but plan to install in my car, an 96 Impala SS.

1891. 500 Hz CW Filter Installation, Part II

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-11 01:17:28 UTC
From: Dale L. Martin
Topic: 1891 Message: 1891

Last night, I installed the YK-117C filter in my FT-100. The result is 0 power output, no 2.4kHz filter action. After opening the radio up three times, verifying no solder bridges, no cold solder joints, no loose leads, connectors or plugs, I finally called Yaesu Customer Service.

Our conversation went something like this:

Him: Yaesu Customer Support. This is Mark.

Me: Hi, Mark. I've got an FT-100 and last night I installed the YK-117C 500Hz CW filter. The radio's HF RF output is now zero. The filter seems to be working fine on receive; signals sound as I would expect they would sound through a 500Hz filter. But, there's no RF output on HF (VHF and UHF Operation is normal).

Him: Let me check it out with someone and I'll be right back.

Him: Dale, there are two spots for filters. Do you have the filter in the front or rearmost spot?

Me: Rearmost. Just its shown in Figure 2 on page 106 of the manual.

Him: Dale, it should be in the front spot. There was a typo in the manual and they had to be reprinted. The XF-117C, 500Hz filter is in the frontmost spot and the XF-117N or XF-117A filter goes into the rearmost spot.

Me: Huh?

More to come AFTER I get the filter in the 'right' spot.

That's extremely interesting, Dale, as my manual is dated 9902n-BY and shows the XF-117C in the rearmost slot.

The filter is now relocated in the frontmost slot. The 2.4kHz filter and 500Hz filter work properly. However, there is still no RF power output on the HF bands in CW mode (hmm...I haven't tried SSB).

antenna. I must keep the wife happy. I only have tech
plus priveleges but I plan on eventually upgrading hopefully to general
class.
In terms of perfecting my code i thought with an hf such as this listening
while
driving would be the way to go. Do you folks feel this is too much radio
for someone that might get general priveleges a year down the road
Many thanks
Mark >>

Hi Mark and the Group,

You didnt tell us how you would use it, if you are going mobile, get the
FT100 and the ATAS system and a good mount with good coax. If you are going
for the radio primarily for home use, go for the Radio and a good multiband
antenna of your choice.. I like the Cushcraft R-5, R-7 or ask around about
the new versions to see how they are doing. If you have the room for a beam
thats cool too!
If you need a tuner, go for the AT11 by LDG electronics in MD, it seems
to be the rage now and could be had for less $$ than the FC-20 and does the
job with less hookups.. I had the FC-20 and I wasnt impressed. Overall, the
radio is super, Mine is a 9E series and I had a tough time getting some rf
troubles under control but its fine now. Its a great radio and at $1199 its a
bargain... Regards Richy

I dunno. I am still trying to get into the Hammarlund website without
much success ;^). Seriously, I get the same results as you. I got
into that site a few days ago without a problem. Don't panic.
Suspect that their server is down or the site is undergoing revision.
However, if you start to see clearance sales on Yaesu gear, might be
cause for concern!!

Hi Dale: (et al)

I put an AM filter in mine, I will look tonight and see where I put it.

Anyway I E-Mailed to ask a probably stupid question.

Did you go into the software and "tell" the FT-100 that the 500 Khc filter
is installed?
I am not sure where in the menu it is but there is a place to let the radio
know if you install ANY filters.

Hi, Charlie.

Yes. I did "turn on" the filter in the Functions listing--It's 31, by the way.

Interestingly, I asked Mark at Yaesu why the 500 Hz filter seemed to work in the 'wrong' slot and he could not answer. He only said that the correct slot was the forwardmost slot. I played with it a bid before I relocated it. If I 'turned off' the 500 Hz filter and 'turned on' the 300 Hz filter (Menu Selection 32), there was no effect, even though the 500 Hz filter was in the 300 Hz filter slot.

I changed it to the new correct slot (a filed-down-to-a-fine-point soldering iron tip, solderwick and a magnifying glass helped--this is not a job for the faint-of-heart).

The filter works in the forwardmost. However, now, when I select the 2.4kHz filter (Function key B), it works as it is supposed to; when I press Function key C, the 500 Hz filter is kicked in.

I just don't have any HF RF power output anymore--VHF and UHF operation is normal.

From: "Dale L. Martin" <kg5u@...>

Last night, I installed the YK-117C filter in my FT-100. The result
is 0 power output, no 2.4kHz filter action. After opening the radio
up three times, verifying no solder bridges, no cold solder joints, no
loose leads, connectors or plugs, I finally called Yaesu Customer
Service.

Our conversation went something like this:

Him: Yaesu Customer Support. This is Mark.

Me: Hi, Mark. I've got an FT-100 and last night I installed the
YK-117C 500Hz CW filter. The radio's HF RF output is now zero. The
filter seems to be working fine on receive; signals sound as I would
expect they would sound through a 500Hz filter. But, there's no RF
output on HF (VHF and UHF Operation is normal).

Him: Let me check it out with someone and I'll be right back.

Him: Dale, there are two spots for filters. Do you have the filter
in the front or rearmost spot?

Me: Rearmost. Just its shown in Figure 2 on page 106 of the manual.

Him: Dale, it should be in the front spot. There was a typo in the
manual and they had to be reprinted. The XF-117C, 500Hz filter is in
the frontmost spot and the XF-117N or XF-117A filter goes into the
rearmost spot.

Me: Huh?

More to come AFTER I get the filter in the 'right' spot.

1907. 500Hz Filter Installation, Part III -- The Saga continues

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-11 17:54:17 UTC
From: Dale L. Martin
Topic: 1907 Message: 1907

This morning, in the cold light of daylight (warm, actually, about 75 degrees), I rolled the car out of the garage, put the antenna vertical, and turned on the radio.

Hmm....seems that 20m is pretty dead with only a few weak sigs coming through. I checked menu #31 (500Hz filter on/off) and it was on. I rolled around to menu #21 (HF TX PO) and pressed Mode to AM. Suddenly, there were all sorts of CW signals (unmodulated, of course). I verified that there was no power output on HF and there wasn't. I switched modes back to CW, then rolled back to #31, turned it off, then went to #32 (AM and CW-N filter on/off) and turned it on to the 300Hz filter. CW signals all over the place.

This tells me but one thing: The 500 Hz filter is in the WRONG location (forwardmost slot).

I thought about what I had done last night in checking it out after I had moved the filter to the new, but now wrong slot, and concluded that (1) I was hearing only strong signals on 20m that were coming through despite there being no filter in the rearmost slot; and (2) I was tired and not very happy: I was supposed to have left for a backpacking trip that evening--I've blown it off in order to get this situation resolved.

While I had the car on the driveway, I washed it and mulled things over. When I finished, I called Yaesu and again spoke with Mark. I told him my experience this morning. He went offline to check it out and came back saying that he apologized but he had made a mistake yesterday telling me to move the filter and that the correct position for the 500Hz filter is, indeed, in the rearmost slot where I had had it the first time.

I told him I still have the zero HF power output problem and would like to send the radio in and (1) have them move the filter and (2) have them restore the radio back to normal operation. So, it's going to them today.

Interesting and somewhat curious note: According to Mark (hmmm), when you put a 500Hz CW or 300Hz CW filter in place, the 2.4kHz filter is disabled and not selectable. Not so. It is selectable, but in my radio there are no sigs there. I tried it out on CW and on SSB. On both modes, the 2.4kHz filter is inoperative. Only the 500Hz filter (in the 300Hz position) works, even on SSB. Even turning off the 500Hz filter (in #32), the 2.4kHz filter is inoperative.

Geez. What a week. I may end up going back to my Ten-Tec.

73,
Dale Martin, KG5U
kg5u@...

1908. FT-100 Questions (again)

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-11 21:39:29 UTC
From: Timothy H. Heaton
Topic: 1908 Message: 1908

The only response to my questions was an excellent answer to #5 on microphones from Bob Heil. If anyone else could answer any one of the other questions it would be much appreciated. Here they are again:

1) What are the features of the FT-100's built-in electronic keyer? Can any type of pabbles simply be plugged into the unit for sending CW? How many characters (or strings of characters) can be stored?

2) Does the FT-100 come with a built-in speaker, or does an external speaker or headphones need to be purchased separately?

3) What does the speech processor do? How is it adjusted?

4) Why are so many of you buying different microphones than the one supplied with the FT-100? Is it deficient in some way?

5) What hardware and software is needed to send/recieve packet with the FT-100? (I have never used packet but have a Windows notebook PC.)

Thanks again any responses. -Tim (WB7NMY)

1911. ATAS-100 Antenna

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-11 23:17:29 UTC
From: James J. Caperelli III
Topic: 1911 Message: 1911

Well I finally did it. A new FT-100 is in a box in my car. I cannot wait to get home and play with it. Anyway the dealer was fresh out of the ATAS antenna. Any out there for sale? I have seen a few here on the list in the past, any still available. Oh yes I did go to a regular storefront dealer and bought the radio off the shelf, decided not to do the mail order thing. The price was the same $1199.00. I bought my FT-890 from him years ago and decided to give him my business again.

1912. RE: Attachments #2

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-11 23:19:14 UTC
From: Walsh, Tom
Topic: 1910 Message: 1912

Note that attachments don't cause infections, opening them does.

Note further that preview of "active content" messages (not an
attachment, as presented to the user) can spread infections.

Setting the IE5 security level to "high" (or more configurably
setting the IE4 security to "disable active content" or some such)
will eliminate the problem with preview of active content.

I've attached the original "word" document, and I hope it doesn't
contain the class virus which has been going around. To avoid the
word macro viruses, configure 'word macro virus protection' to on.

From: Richard W. Solomon
Topic: 1891 Message: 1914

My FT-100 manual came with an insert that showed the correct position of the filter. Perhaps yours got lost.
I installed the CW filter with some trepidation, but it worked !!
Had it now almost 7 months, use it with a VHF/UHF Duo-Band antenna and a Hustler HF systm.
I LOVE IT !!

To: FT-100 List
Subject: [FT100] 500 Hz CW Filter Installation, Part II

From: "Dale L. Martin" <kg5u@...>

Last night, I installed the YK-117C filter in my FT-100. The result is 0 power output, no 2.4kHz filter action. After opening the radio up three times, verifying no solder bridges, no cold solder joints, no loose leads, connectors or plugs, I finally called Yaesu Customer Service.

Our conversation went something like this:

Him: Yaesu Customer Support. This is Mark.

Me: Hi, Mark. I've got an FT-100 and last night I installed the YK-117C 500Hz CW filter. The radio's HF RF output is now zero. The filter seems to be working fine on receive; signals sound as I would expect they would sound through a 500Hz filter. But, there's no RF output on HF (VHF and UHF Operation is normal).

Him: Let me check it out with someone and I'll be right back.

Him: Dale, there are two spots for filters. Do you have the filter in the front or rearmost spot?

Me: Rearmost. Just its shown in Figure 2 on page 106 of the manual.

Him: Dale, it should be in the front spot. There was a typo in the manual and they had to be reprinted. The XF-117C, 500Hz filter is in the frontmost spot and the XF-117N or XF-117A filter goes into the rearmost spot.

Me: Huh?

More to come AFTER I get the filter in the 'right' spot.

73,
Dale Martin, KG5U

Probably quite true but there is also the fact that some people have an e-mail account which is charged on a volume and/or time basis and with unwanted attachments, the costs to these people go up.

Besides all of that, it is just not good etiquette.

73 de Alek VK6APK >>

I can agree that its not good etiquette, although I personally see no harm
in it that doesnt make it right. It boils down to personal opinion at that
point. Not to dwell on it but Onelist has an area for each "group" which
allows subscribers to upload and download files available soley to this
group.. Read the FAQ as it explains this process. BTW, if anyone has an email
account that charges by the bulk of uploads and downloads (I had compuserve
in the mid 80's, they did this!!) they should seriously look to find another
ISP as this is not a normal practice in thr 90's.
Netzero offers free access and file transfer for no additional cost. I am
sure its not alot but it suits the purpose.. Anyway, back to the subject of
the FT100. If anyone has any files they would like to share, you have my
email address so upload away..
:-) Richy

Just to make things clear here.
I have turned off the attachments for this list.
If you have a file to share with the group please put it in the FILES area
of the list.
We have 5 meg of space to fill up so have at it.
To find the area go through the Onelist web site and find your way to the
area for this list.
You will see an area called files. It is self explanatory from there.

1928. ft-100 icons in shared files

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-12 21:10:06 UTC
From: Robert Gauss
Topic: 1928 Message: 1928

I have placed the .jpg file and the .doc file in the shared files area.

I also think people are over-reacting to the issue of attachments. If they had been blocked we may have never received the .doc file from Mike in the first place.

But I can understand the owner not wanting the list flooded with attachments and his right to block them if he wishes.

Unsubscribing in a snit over this is cutting off your nose to spite your face. Just cool it and go with the flow. Starting a flame war is the one sure way to drive people from the list.

Another for what its worth.....
My FT-100 manual is version 9907V-EY
It shows the XF-117CN and the XF-117A in the slot closest to the front of the Radio.
I'm not sure any more which manual or which addendum is correct.

I guess thats why we have this fine List to answer Questions???

Gotta Love that FT-100

Thanks Bob,

One of the nice things about onelist is that it does support a file area for us to put any attachments in. I belong to several mailing lists and none of them allow attachments.

Let's get back to talking about our GREAT FT-100s

1940. ATAS-100 VHF-UHF Operation

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-13 20:54:29 UTC
From: porterpe@xxxxxxxxx.xxx
Topic: 1940 Message: 1940

I have the FT-100/ATAS-100 combo. It seems to work well on HF with only a minor glitch once and a while (the ATAS-100 seems to "stick in one position and does not move when it receives a command from the radio unless I manual move it a little, then it works fine for a while until it locks up again), However, I am not able to get the antenna to move to its fully retracted position for VHF and UHF operation automatically (or manually).

I have a Comet 706A duplexer attached to the radio outputs and the antenna as required. The "Function Menu 61" setting is set to ATAS-2 as directed by the FT-100 manual.

When I change the radio frequency to 2 meters or 70 cm the "tune" button will not start the tune process and no tune icon appears, in fact, nothing happens, the antenna does not attempt to move and the radio doesn't seem to be sending the antenna a command to do so. Also, when I key the mike and try to retract the antenna manually, nothing happens either when the radio frequency is set for VHF or UHF.

Am I doing something wrong? The manual made no mention of any duplexer that did not work with the ATAS-100; is the Comet 706A suitable for use with the ATAS-100? Is there a separate procedure for operating the ATAS-100 on VHF and/or UHF not covered in the manual? Any help will be appreciated.

Thanks,

Dave Porter-N4IJO

Mark,

I'm on my third ATAS-100 since June... the first one worked for about a month... then stopped moving. Yaesu quickly turned around my repair with a brand new replacement. That one worked for a day... at which point they asked to see my FT-100.

When I received the FT-100 back from service, I plugged it in... and the ATAS-100 still didn't work! Sent the second one back, and this time they "repaired" the antenna... replacing an IC.

Now, I'm on my third... and it's starting act up. I usually retract fully to enter my garage... and when I go out the next morning, and select the 10 or 12 meter band... it says it tunes OK... but doesn't move. I have to start tuning on 15... get a match... and then tune back to 10 or 12.

I'd be interested in knowing what other "fixes" have been applied. (The pair is really a great station... just wish it would stay fully operational for a period!)

Geoff

Hi,
From listening to everyone it sounds like the atas-100 is a great antenna when it
works.Unfortunately,alot of you have had many continued problems with it.
Are there anyother people oput there that could reccomend another antenna system that works well with the ft-100.

I used the Comet HA-UHV (I think that is the model number) before I got
the ATAS. It covers 440, 2M, 6M, and your choice of one or two HF bands
(40, 20, 15, or 10M) on one antenna.

It worked just great but you get REAL spoiled with the ATAS being able to
work ALL of 40M or 20M instead of a little 30KHz slice.

1951. RE: DEAD ATAS-100

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-16 13:18:36 UTC
From: Roger Buiten
Topic: 1943 Message: 1951

My experience is the same as William's. Mine worked from day one, and still does. I've had it for a few months now, and it behaves as specified. Being able to tune it - automatically - without having to get out of the vehicle and either adjust a length or change a whip - directly from the face of the radio rather than having an extra control box - and being able to cover all of each band except 80 - it just doesn't get better than that. I replaced a Pro-Am set of antennas with the ATAS-100, and it's a dream.

I am curious as to why so many have problems. I don't retract mine when I go into the garage, because it would still be too high. So I just unscrew it when I want to go into the garage, and I screw it back on when I may want to use it.

Knocking on wood that mine will continue to work so well ...

Mark:
Actually, it depends on what you consider "low profile". If you mean not objectionable or not visable then there are a number of reasonable performance alternatives you have including a variety of wire antennas using small gauge wire (which makes them near to invisable. If you mean not to large, then it really depends on where you have to mount them and what kind of ground you have availble. I should probably also ask if this is for a mobile installation, althought I suspect not.

Date: 1999-11-16 22:32:56 UTC
From: Stoli126@xxx.xxx
Topic: 1954 Message: 1954

Hi everyone
Sorry I should have said my ft100 should I go with it will be mobile. I am new to amateur radio only having been in it for about a year. My gift from my wife is going to be an hf radio of my choice for the vehicle. It was all hinging on passing my 13 wpm test which I did thanks to my elmer. My elmer is not really up to date on hf rigs so I need the help of some of you fellas out here. From the reading I am doing qst cq etc it seems that the ft100 with the compatable antenna system is getting good reviews. I plan on running the rig in a Ford Expedition. I think I am sold on the radio but the only barrier I agreed to with my wife is that I will go somewhat conservative on the big antenna as she refers to it as. Do u think the atas 100 I believe it is will be a good compromise. I need to park the vehicle under a carport so I am wondering does it retract fully. Are u people that are running this combination happy on the most part or should I be considering another antenna system. I could really use some good advice as I am somewhat of a Newbie
Many thanks
Mark

Gene
In my manual, issue 9902C-AY, page 106 it shows the 6KHz AM filter XF-117A OR the 300Hz CW filter XF-117CN occupying the front slot and the 500Hz CW filter XF-117C in the rear slot.

You CANNOT install the 300Hz filter AND the 6KHz filter because they occupy the
same slot.

Change your 300Hz filter for the 500Hz model and put them in the correct positions and all should be well.

You gotta keep in mind the fact that the radio is very small and so Yaesu can't
offer every filter option in such a small space. You'll have to compromise .

73 de Alek.
VK6APK

ps: My radio has just been sent back to the dealer for the 70cm fix and installation of the 6KHz AM and the 500Hz CW filters. Hope they both work when I get it back.

Cheers.

BOTH IF filters you have go in the FRONT Slot!
The AM and the 300 Khc both go there so I guess it is a 1 or the other deal.
May be that there is no way to use the 300 Khc in the rear slot, I am not
sure.

Roger....I have had the ATAS-100 for 7 months and have had no problems....I mounted the antenna on a bracket about 18 inches off the ground. That means that the antennna is never more than 72 inches off the ground and never has to be removed for my garage or any parking garage. The antenna has not been removed from the bracket in 7 months...Also...the safety of keeping your eyes on the road while the antenna achieves a match is worth a lot....especially if you have a wreck......Dale KC2PZ

Yes mark....I have had my ATAS-100 mounted about 18 inches above the ground on a bracket bolted to the frame of the car and I have never hit anything overhead in any parking garage in 7 months...Dale KC2PZ

Your manual may be wrong. Is the 500Hz filter shown in your manual as closest to the front of the radio, then the 6kHz/300Hz filter position, then the 2.4kHz filter? If that is indeed the way it is shown, it is incorrect. You have an older manual. I went through this angst last week! :-) (there are two versions of the filter location identification: the early version is incorrect and is usually accompanied by an addendum sheet; the later version (my version is 9902n-BY on the back cover) is correct. You need to move the 6kHz filter to the forward position for it to work. I can only assume that you need to move the 300Hz filter to the aft (500Hz filter) position. If that's the case, to use the 300hz filter, you need to turn on the 500Hz filter (menu #31) and select the 500Hz filter with the C buttons. To turn on the 6kHz filter, use menu #32, and button A. OR (and I would think that this should NOT be the case) You cannot use 300Hz filter if you are using 6kHz filter, and vice-versa. That seems pretty far out for this neat little radio. I would expect that the 300Hz filter will work in the 500Hz position....all you have to do is come to grips with punching 500Hz instead of 300Hz button to use it. 73, dale, kg5u -----Original Message----- From: wd5fdl@... AND take it with a grain of salt, too. Don't forget, Dale, when I called them about my filter 'problem', I was told my 500Hz filter was in the wrong slot, when in fact, it was in the correct slot because my manual was a newer version and had the corrected graphic, BUT the Yaesu technician told me it was wrong. The next day he told me he was sorry he had told me the wrong thing...that I and my manual were correct.

I've been very happy with mine, mounted on the trunk of a ford t-bird. But, that's not near as high as the vehicle you will run with. My wife had a bit of complaint at first about it, but now refers to it as my ever ready penis. She gets a bit of a chuckle about it, given it's design.
It's not a terribly unsightly thing, but it does have a bit of a profile to it.
Regards, and hope you enjoy the rig.

1965. Filters This may work!!

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-17 04:53:39 UTC
From: SS409SS@xxx.xxx
Topic: 1965 Message: 1965

You may be able to use this setup by doing the following.

Determine which filters occupy which slots..

Activate the proper filter in the proper slot (300hz cw in this case) then activate the one thats occupying the other slot by telling the menu that its another filter.. For example, you can only fit two optional filters, lets say a 6khz am and a cw filter but the am filter doesnt work because it belongs in the same slot designation, tell the menu that its a filter that belongs in the slot, activate that filter in the menu and the FT100 should use the am filter in the wrong slot but the filter selection will read another optional filter (whew!!).. In other words, trick the ft100 into selecting the filter in the wrong slot by activating the slot (for another optional filter) and remember to write down the new "bogus" filter button.. I hope this makes sense :-P Richy

i installed my 300 hz filter in the front most slot and the am in the rear
and the am filter did not work but the 300 hz filter did and Just for the
heck of it i swaped the filters and the 6 khz filter works fine
and the 300 hz filter works ok but you have to press 500 / C not 300 / D button .
because its in the 500 hz filter position and my atas 100 is working now
i just did not let it time out.also i found a piece of paper that
came with my atas 100 that said it had a clutch .
so till the motor voltage turns from pos to neg or neg to positive
sending the ant in the other direction. 73's gene

Mine has worked fine on all the bands including warc......It is a bit noisy as it is being retracted back into the tube. This antenna when properly installed (as high on the vehicle as you can get it) (center of roof is preferred) is (all things considered) the best way to go. The radio is designed for it and it is extremely convenient. I do believe that with my Heil Pro headset and foot switch (PTT) and the atas100 antenna (Push to tune!), that I have am at the pinacle of mobile amateur radio. By all means, I highly recommend this antenna over every other that I have used...Outbacker Perth , Bugcatcher, Hustlers, Mobile Mark, Hy-Gain etc. 73 Mike K8YOY

If anyone has used the High Sierra antenna, I'd appreciate a report. On paper, it looks like the ultimate, since it is much longer, and covers 80 meters as well. But it is a bit unsightly. And it requires a small outboard control panel to run the motor. I believe it also requires tuning manually, watching for the lowest SWR. Anyone have any experience with it, besides the company?

My ATAS 100 quit working after a full summer of working great mobile on the back of our RV. I was testing it out to see how much I needed for a portable ground plane since I am going to take it and the FT 100 overseas. It just stopped working during testing. I then reset the CPU (only the menu) and the antenna resumed working. Good Luck Tom VE6TRM

1973. no problems

Yahoo group: FT100 (1998 — 2000)

From: nf7r@xxxxx.xxx
Topic: 1973 Message: 1973

ALL,
Have had ser 9E031533 and an ATAS-100 since May'99, and no problems... have made the wideband xmit mod, verified it, and then reset the radio to normal as don't anticipate needing it until I get an xvrter...it's nice that having made the hardware change for the wideband xmit mod, I can enable/disable it from the front panel as needed. I also installed the 500hz/6khz filters...all works great...my comments are:
1. A. Re: the ATAS-100: my XYL and post teen daughter can live with the set up, and my daughter has better fashion sense than I...I know I should be the captain...but have two admirals in the house...my son, KB7SXA, of course thinks it's all ok :) and B. It works very well for me on ALL bands, and is very comparable to my other dedicated two meter antennas. Specifically, it works ok on 440...but I admit I don't use 440 that much... but it does hit the repeaters and I only get 3 bars of swr on that band... ALL other bands the swr only rates one bar. I ran some tests in dead time over SS weekend, and the SWR is flat on 2m regardless of position of the ATAS. Means I can be on 40 and switch to 2 on the fly without repositioning the antenna...nice when I only want one antenna on the car...mounted with highly modified RS trunk lip mount that I homebrewed myself, so I can switch to my other hf antennas for 75 or 160 when I want...do have to lower it for the carport, but not remove it, even with the trunk lid mount.

2. The dreaded filter mod: I had heart failure when I read about the filter positions, and almost changed mine again. I then realized if they were wrong, they were at least working, so I left them alone. Was relieved the NOT for the faint-hearted...I've been on the air since '66, and homebrewed a lot, but the manual leaves a lot to be desired. I broke a couple of the flat ribbon clips in the process. I cheated them back and have had no problem in the past months. I do have to get new clips ordered and replaced just to have total peace of mind that the connectors wont wiggle loose someday. I believe that it won't be a problem because even jury rigged as I have them, the box is so cramped that there is not a lot of room for the cables to go anywhere. My recommendation is to let the factory install the filters unless your are sure of your skills...I thought I was, and now realize I was just lucky...
Last note on filters: the DSP 240/120/60 works so well, that I recommend the 500Hz filter, and use the DSP to go narrower...300 Hz filter and the DSP are redundent, and in some cases the 500 Hz filter fills the gap between 2.4 and 240 quite nicely.

3. The rig is a power hog...at home, my ASTRON 20A supply won't cut it on full power, so I run 75% power til I can get a recommended 23A or greater supply....that's my fault as since the 20A supply handles my IC-735 just fine, I assumed it could handle the FT-100 with the same nominal 100W output. I was wrong... obviously when Yeasu said 23A they weren't kidding...chirping

and fm'ing are the symptoms here.

4. In mobile service, I was having distinct problems with 2M rf in the audio, and cured it with a package of RS clip-on chokes on the dc power leads. Other bands were clean from the start.

5. I (not recommended, but I have two cars I like to switch between) use a cigarette lighter plug for my power connection. I have the RS 20A filter in line with the dc line, and have no alternator whine or noise on the radio...EXCEPT on 2m at full power. I am sure that I am taxing the rating of the filter, and am confident that a 30A filter that I am getting will take care of that...FM being 100% duty cycle would explain why it acquired the whine and SSB at full power is not affected. Have ran cw mobile, and no reports of whine, but will rest better with the more robust filter. BTW, NO problems with spark plug or other engine noise. The NB works extremely well, just like all the reviews say.

6. I have the antenna grounded securely via the trunk clip mount, and the rig grounded to a seat/frame screw. The control head is held by an elastic "bungee" type boot blousing band to the ashtray...it's secure and works fine....and am using an outboard speaker behind the between seat console. I find the three wire remote to be more flexible for my needs. I have the radio under the drivers seat.

7. I constantly move the radio between my two cars ('91 and a '98 Toyota Camry), as well as my shack, so the installation is more ad hoc than if I had a dedicated radio for each car, but it is clean, out of the way, and relatively convenient to swap between cars, antenna and all, in about 10 minutes.

8. Let me emphasize again, I have had no problems with the radio on one cross country run between MD-UT-MD, and on several overnight and day trips, as well as constant in the shack use. The ATAS-100/FT-100 combo has met and exceeded my expectations for mobile enjoyment. I am still catching up with a nice run of 6M SSB contacts while driving through Wyoming using this nice combo.

9. In sum: The up side is that it is a great mobile rig. The down side is that it is a great mobile rig. What I mean to say is that it being menu intensive, it is not as good a base rig as one might want. I wouldn't recommend it as a dedicated base station. But where I need a small footprint in the house, and greatly enjoy mobile/portable/camping, the ups far outweigh the downs in my situation. I don't work for any radio company...and would be happy to respond off line to any comments...but had to delurk and add to the other comments that mine has worked as advertised from out of the box and add a couple of comments for those considering the purchase.

My experiences with radio are: NF7R, ex KC7BM, ex WA7GQD, ex WN7GQD, former 7J7ABD, op at KH6SP, K6NCG, WA1NAN, KG6AAR, KL7AWR, and 30 yrs as a Navy communicator ashore and afloat. Of course that just means I've had time to make a lot of mistakes! And still have time to make

some more, I hope!

Please excuse the length of this post, I'll return to the shadows now!

73,
Don, NF7R/3

1974. ATAS-100 Problems????

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-17 22:58:13 UTC
From: James J. Caperelli III
Topic: 1974 Message: 1974

I have had my ATAS since Saturday and already have developed a love hate relationship with it. Less then 20 minutes after installing it and practicing (Standing outside the van and marvel at it going up and down) using it, I ran into a problem. While trying to tune one of the bands, I forget which, the antenna fully retracted and stuck there for the longest time. Actually until I pressed the "TUN" button again to stop the tuning process. I then forced it up slightly using the microphone and the up button procedure for manual tuning. Well it then tuned fine and I wrote the incident off to inexperience or doing something incorrectly.

WELL !

Tuesday I had to work about 150 miles down the road. I was finally excited to drive this far now. What the heck, a new radio, antenna, and a bunch of new bands to talk and listen on while mobile. Well for the first 100 miles or so the ATAS system worked flawlessly and the signal reports were very good. While switching back from 40 meters to 10 meters the system flaked out. I noticed the "PO" meter was showing 50 watts or better and the SWR was topped out. The system tuned for what seemed liked several minutes and it finally stopped with the high SWR icon. I played a little with manual tune while driving and it did not do a thing. So I switched to 20 meters and it tuned fine. After arriving and working up to lunch time, I finally had time to go out and play with it. I raised and lowered the antenna from end to end and nothing worked on 6, 10, and 15 meters. The PO reading was very high, I suspect the radio was reporting the power out summed with the reflected component. I visually inspected the antenna, mount, connections, and feed line, everything seemed fine but, the antenna still failed to tune those bands.

Well I worked the rest of the day and that night drove back home. While driving back I was about 2 miles away from a planned stop at a rest area and decided what the heck, I will try 10 meters again. I figured with the stop coming up in a few minutes I could see what position the antenna would end up in and try to further determine what is going on here. Well I hit the "TUN" button and it was not more then 15 seconds later it tuned up just fine. I was shocked and tried again, even switching bands back and forth and all was fine. So I made a few contacts on 10 meters just to test it, you know before God turns it off after dark, and all was fine. Now it works!

So,

Has anybody else experienced this problem?
On these bands or others?

It appears that there is more involved then just changing the length of the antenna going on here, it must also switch coils or something internally.

Since the manual adjustment of the antenna length did not solve the problem on those bands, I figure that some sort of relays might be involved internally to do the switching.

Has anyone had one these apart?
Does this suspected switching take place in the antenna or the radio?
Could it be my radio with the problem?

So what is the love part of my relationship with this antenna? I must qualify first that I never was serious about mobile HF before, just 10 meters. So my experience or opinion here might not be that informed of some of the more experienced mobile HF users. Anyway all of the signal reports I received were very good to excellent. A few found it hard to believe I was mobile. Those reports really stroked my ego! Also the biggest thing I love about this system is its ease of use. While on 20 meters listening to a scheduled contact, the mobile and base had decided to QSY to 40 meters because of band conditions. When the mobile stated that he had to find a good place to pull over to switch his antenna, it reminded me why I bought the ATAS-100, and why I am very happy including the bugs, quirks and problems.

1975. RX Audio Question

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-17 23:21:12 UTC
From: James J. Caperelli III
Topic: 1975 Message: 1975

While using the FT-100 the other night on the road, I came across what appeared to be a backup because of an accident. I decided to tune to 27.185 MHz, I think CB channel 19, to listen to the truckers opinion on the backup. I was shocked, the audio from the FT-100 sounded like pure CRAP to put it nicely, almost unreadable. In the past my FT-890 would hear these stations with beautiful audio reproduction or as good as can be expected considering the roger beeps, echoes, and microphones jammed half down the throat of someone screaming over the sound of 700 horses of diesel power.

Now I realize that the transmissions on these bands are way over the legal power limit and splattered all over the spectrum by less then spectacular equipment. So, considering all of that I still want to know what is going on hear? Is it filters, or the RX bandwidth of the FT-100? Has anybody else tried or experienced this?

Also somewhat related, has anyone done the mods on the FT-100 to open up the TX and use it on 11 meters? Of course with power cut down below 5 watts. Does it tune the ATAS-100 antenna (When the antenna decides to work)?

Don thanks for those in depth words of your experience with the FT100 and ATAS-100. One note on the use of the noise blanker. It is very good, however, on strong signals with the factory default settings it causes distortion. When this happens just push the ipo button or the attenuator button and the distortion goes away......I was amazed when this first happened.....the audio became clear and jumped up out of the noise.....Dale KC2PZ

Jim....You may be getting reflected swr from the coax shield and causing this problem.....I put a 2 to 2.5 inch ferrite donut under the ATAS-100 and wrapped 3 or 4 turns of coax through it. This helps the antenna find the sweet spot without radiating RF in the car and gumming up the sensing circuitry....also, grounding the case of the radio helps...Dale KC2PZ

Jim.....you may have heard truckers setting within 100 yards of you
running 500 to 1000 watts....it could overload the front end....try
hitting the ipo button and/or the attenuator button. Also, what speaker
were you using? The internal speaker is very susceptable to distortion
on loud signals. I use an old 4 inch commercial mobile speaker I found
at a hamfest. Dale KC2PZ

The radio is stock out of the box, no options installed. NB was tried both on and off, along with DSP (DNR, DPB, DNF all in default factory settings) tried in all various flavors. I tried pushing some of the filter buttons selecting 6.0 or 2.4 for AM results were not desirable at all. I did not play with the AGC settings. Any ideas?

I do suspect the fact that these guys could have been sitting right next to me. I should have used a couple of rusty razor blades to listen to them. I am using a fairly decent external speaker, but it is not the commercial mobile Motorola model I plan to install. I need to try the IPO but, I think I did hit the ATT button. I do not know what ATT might be set for under the menu though.

1985. ATAS-100 Problems???? Read the manual!!!

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-18 06:43:50 UTC
From: SS409SS@xxx.xxx
Topic: 1985 Message: 1985

I am hearing alot of complaining about the ATAS 100 getting "stuck".. Read your manuals please! The ATAS on occasion will either go all the way up or down and wind out until the preset timer in the radios firmware stops it or the user stops the tuning process.. I noticed that this problem occurs more when the ATAS is used for 2m or 440 ops and the user attempts to go back to HF.
If you find yourself in the above predicament, look at the antenna, set the band that you want, key the mic and manually tune the antenna for a match i.e. if the antenna bottoms out and you want to go to 20m then go to 20m, key the mic and hit the up button to raise the ATAS, when you get a match there release the mic or touch up as necessary. You can sometimes make the ATAS regain "consciousness" by tuning the ATAS for a band sandwiched between two others, momentarily tune the antenna and determine which direction it wants to tune in and then set the radio for the band its heading for, once it stops the ATAS will most likely regain its bearings and tune properly (until you go to UHF or VHF again :-) .

Stop sending your antennas in for repair and bothering Yaesu! I have my setup in my 89 Firebird which routinely travels to the Bumpy Bronx everyday, once I got over the ATAS minor RF related faults it was smooth sailing for me ! The problem to me seems to be the firmware in the radio and not the antenna. Since the radio doesnt "see" the antenna, it makes a guess based on where it has been to send the power up the line for the tuning.. If the Radio successfully tuned onto 20m from 17m and you go to 10m it knows which way to crank the coil. Sometimes the radio loses touch with the antennas current location (since it doesnt know this anyway) and it will crank in the wrong direction until it times out and on the second attempt wind its way in the proper direction.. I am sure there are plenty of broken ones out there as there are always bum products even from the best manufacturers.
After reading this, if you still feel your antenna is broken, send it to me!!
Tnx Richy KB2CPW

Jim Caperelli III >>

You must have the 6.0 filter installed for it to work, after adding this
filter go to the menu to engage it. Everyone raves about AM reception after
adding this filter.. Good Luck with the New Radio! Richy

73,
dale, kg5u >>

I changed the menu setting to allow for rf gain control on ssb and squelch
action on FM, this works great but you have to remember to rotate the control
when you switch bands (for example, 10m SSB to 440 FM) otherwise you dont
hear nuttin..
It would have been nice if you could invert the controls via the menu so
that the RF gain is high and squelch is buried requiring minor touching up
when in FM mode..
It also would have been good if you could custom set the ABCD buttons up as
you like them . I would put the Tune, ATT,IPO,NB on one "bank" as these are
probably the most frequently used controls. Richy

Hello Richy and everybody.

My ATAS-100 has worked flawlessly since spring. I have been assuming that some folks do have broken ones since they say that Yaesu gives them a replacement. Or maybe this is 'no admission of guilt' by Yaesu, and they do this to keep the customer happy.

Since the 'confused autotuning' topic has come up, I am reposting something from June. One point from this that I would add to Richy's suggestion: regardless of where it's been, once you give the antenna a quick manual poke to establish the right direction, autotuning is back on track and you can let it take over, you don't have to watch for a manual match, or wait for the timeouts.

It's easy for the operator to push buttons that put the autotuning into confusion, but having done so, there's a good chance you can also help it recover quickly. But if your autotuning is generally unreliable, that's something else -- like grounding etc.

BTW, this refers to manual 9902n-BY. From the discussions of filter installation, we now know there are different versions of the manual out there. If anybody's manual looks like it is different re this stuff, pls let us know.

I would offer some things I've noticed that don't quite agree with the book.

It says that stopping manually at hi swr "will not permit further automatic tuning" (pg63), and the system will need a manual refresh. This isn't what I see -- here's my description of how it works.

If I manually tune the antenna and then invoke auto-tuning, the antenna begins moving in the last manually-entered direction, no matter what -- whether it was tuned to resonance or to a hi-swr point. Similarly, if I interrupt auto-tuning by hitting TUN, that locks in the next auto-tune direction. If for example you stop tuning on one band, then change bands, and that last direction was away from the current target, then auto-tuning is going to go in the wrong direction. It will then run for that minute or so (that's the only way it has to be sure it has hit the stops), then reverse back towards the target. That's tuning via the "long path" - hi. But if the last manually-entered direction was "right", the auto-tune heads right toward resonance, and it's really spiffy.

Importantly, after a successful auto-tune, it always goes the right direction when changing frequency or changing bands. So: if you know that it's heading the wrong direction, just give it a quick manual kick in the right direction, and then let TUN take over. For me, auto-tuning always succeeds, so re-tuning is a snap.

So vis-a-vis the book (pg63):
Fourth bullet: 'accept' the manual setting isn't the same as successfully completing auto-tune.
Fifth bullet: it will permit further auto-tuning, but it may not start in the right direction. I don't know what that refresh stuff is all about.

I think I've got this right. Does this fit with what everybody is seeing?

The antenna and the auto-tuning work really great for me. You really need a good counterpoise/ground. It would be interesting to know how many segments of the tuning bargraph (or even real swr numbers) people are getting when they have good/bad/flaky tuning.

73, Ed, K1GGI, #9E031258.

I didn't get a manual with my ATAS 100. As to "bothering Yaesu"; it would be nice if someone answered the telephone in service. It was 48 hours before my call was returned. If someone (like you) had taken the time to post your message, I may not have had to spend the time, ten dollars and waste the energy to send the antenna cross country. In addition, I did try to tune it manually and there was no motor response at all from the antenna.

Mark and others,
Don't be so concerned with paying a buck or so less. Go with the Dealer you know the best and are the most comfortable with their service and customer support.
You will soon wonder how you ever got along without the FT-100 and ATAS-100

Audio on the FT100 is not very good without the 6Khz filter.
If you intend to use it for short wave, 10 meter AM ect then the filter
is a must.
The audio inprovement is worth the cost if you like AM.
I think the radio should have been sold with this filter.

I wish they included the AM filters, but I have not seen many Manufacturers
that do.
I had a FT920 and it was an option. At least Yaesu knows about AM.
A lot of Icoms do not even have an AM filter as an option!
I am not sure about Kenwood.

The antenna and the auto-tuning work really great for me. You really need a
good counterpoise/ground. It would be interesting to know how many segments
of the tuning bargraph (or even real swr numbers) people are getting when
they have good/bad/flaky tuning.

time to post your message, I may not have had to spend the time, ten
dollars and waste the energy to send the antenna cross country. In
addition, I did try to tune it manually and there was no motor response
at all from the antenna. >>

Hi Mark,

I didnt say that everyone was not reading the manual, I did also admit
that some but not all of the ATAS antennas are failing. That goes without
saying for any product. If your antenna doesnt work, it doesnt work... Some
basic things to remember are:

The ATAS uses the HF-6m antenna jack exclusively for the voltage signals to
it.

The ATAS has been known to malfunction with certain duplexers effectively
"shitcanning" the voltage signal to the ATAS causing problems when tuning..

The ATAS will screw up from time to time and following Ed's suggestion, it
can be brought back on track quite easily.

The ATAS must be configured properly in the setup menu to work correctly

The ATAS setup works better IMHO if you use a separate antenna for UHF/VHF.
Less glitches when tuning etc..

Good Luck.. Richy

I would like to purchase an FT100 and the ATAS antenna this week. Can
someone tell me the phone number and name of a reliable source with a good
price.
I have the HRO Catalogue but I heard there are sources to get the radio
for less
Many Thanks
Mark KC2ELT >>

Mark,

Check out Lentini in CT.. I drove there to pick it up and they were
excellent.. I heard that the price dropped to $1199 so try to locate one for
that price if you can. Mine is a 9E vintage meaning May of 99 E= May
9=99.. Not that there are any problems but if there were any mods done the 9E
,F ,G, H, etc.. Will have them over the earlier ones.. The ATAS can be
purchased from $279 to $329 so shop around..
This is one great radio, it has its faults but to me this is the best piece
of gear to come along in a long time... Good Luck and Hope to hear you on
the air soon.. Richy KB2CPW

Richy: I am not sure I understand. Why does menu 61 have to be set for ATAS-2 when using a duplexer and the ATAS100 if the radio uses the HF/6 jack exclusively for tuning voltage? In other words, what difference would it (does it) make ATAS-1 or ATAS-2 ?

My FT100/ATAS came from HRO Denver a few days ago - 9H serial number on the
rig which was 1199 - the antenna was in the middle of the above range.

2001. 6KHz filter/NB/

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-19 03:14:25 UTC
From: nf7r@xxxxx.xxx
Topic: 2001 Message: 2001

All,
Had to add my addn'l 2 cents worth...I'll bet 27.185 will sound very good at full rf gain once you add the 6KHz filter...I noticed that the unbridled front end caused me grief in the SWL bands, and very noticeable on 10 MHz WWV...seems you can hear 20 KHz either side without the 6 KHz filter. When installed I have been very pleased with it's selectivity/rejection of even very strong adjacent out of passband signals...equal or better than any radio I have ever used. And it's a lot easier than playing with the rf gain/IPO/ATT...although nothing will keep the KW Kenworths from playing havoc with you from the next lane...but outside the nearfield (a car length or so) I've haven't had a problem since installing the filter (last June).
The wideband transmit mod will work quite well on all hf freqs, including 11 meters...but bear in mind the illegality of doing so on the face of it...bona fide emergency situations notwithstanding. I'm not saying don't do the mod, but just weigh the "what ifs" before you key the mic...I made the hardware change, but have elected to keep the software implementation disabled, I'll really have to think hard before I reprogram the rig and jeopardize my ham ticket just so I can talk on 11M...Instead I keep an old 40 channel HELP HT under the seat in case I think I can help a situation by talking. Funny thing, I haven't had to do so...yet...
but it is nice to MONITOR 27.185 when the traffic gets sticky, and it's even nicer to get passed the detour and go back to the ham bands! :)
I do use an old Motorola mobile speaker acquired at a hamfest, as the internal tiny speaker does seem to distort at high audio levels, and just doesn't have the punch of even a mediocre outboard speaker...
Lastly, the noise blanker, if too high, will introduce it's own distortion products, especially on SSB. I turn it up to where the noise is blocked, and then back off until there is no distortion/intermod on the signal I want to listen to. This problem seems more pronounced on a crowded band, and is not the radio's fault...just an artifact of how the NB works, same as on my IC-735.
In response to a query, I do use the separation kit in the cars, and use the radio as a "unit" in the shack...and yes the tiny screws used to attach the cable to the "body" of the radio are a pain, wish they would have used captive screws at least like on computer cables. But I do use a piece of electrical tape to hold the screws in place when the unit is not separated. If somebody has a better way to keep the screws with the connector I'm sure I'm not the only one who would be grateful!
Haven't completely figured how the this list works, but want to thank those who commented on my posting, and wanted to say thanks to the constructive feedback... I've learned a lot here.

73,
Don NF7R/3

Possible suggestion:

Cut the cable and put in some type of quick disconnect connector then
rather than mouting the front panel to the body when using it inside find
some way to conveniently mount the front panel and use a short cable.

To all--
I little shortcut I've used. Since I like using the A/B vfo (A button) frequently, I have found that no matter what function page I am on, I can hit the DSP button, which goes to the last page in the sequence, then hit the "func" button, and I will be at the A/B page, which is at the top of the sequence, which saves me several pushes of the "func" button. BTW, it looks like the paint is wearing off of the "func" button already. Jim kb8unu

Dan,

No, you don't need any level converters. If you have the cable to connect to the back of the rig (pigtail) then you can just do a direct connection to the RS232 port on your computer.

I did purchase one, but found that you don't need one, though I didn't have the right connector for the pigtail anyway.

2012. Tuner Note...

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-21 17:49:33 UTC
From: mikef
Topic: 2012 Message: 2012

There have been some notes recently from the group, with high SWR problems on 10 meters, as well as 12, 15 and 17 using my dipole (fed with 300 ohm feedline and an MFJ tuner). Even with the RF output set low (10 watts or so) the output SWR would go screaming sky high, and the power seemed to be at 100watts.

I took the hint from the earlier mail and put a AMIDON core in the output coax of the rig with 4 turns around it and it took care of the problem.

I had the coax grounded (heavy shield braid to a ground stake) but that didn't cure the problem all the time.

I'm guessing that the RF gets into the rig and affects the internal circuits and the processor settings. Getting rid of the RF feedback seems to help. I'm going to try to find some smaller ferrite core to put around the coax. The donut that I have in line is a bit big...

Dave, I make it a practise, when pulling into a low garage or what have you, to flip to one of the calling frequencies for 6 metres, which I have programmed into the ft-100, and hit tune. I believe a retraction to 6 metres takes the antenna to it's lowest point, or close to it.

Folks, I am a car dealer which means I don't stay in the same vehicle a lot. Well, the first installation I had was in a Crown Vic with the ATAS-100 clamped on the trunk. I asked the tech who installed it to be sure it was grounded, and we found a crimp splice near the mount to which he wrapped a wire and grounded to the car. Also the radio was securely bolted to the trunk. I had mediochre results, with lotsa SWR icons.

Anyway, I am heading on a road trip and I temporary mounted it into an Expedition. This time the (different) installer put the antenna on the HOOD lid right in front of the driver. Ugly but about the only option because the vehicle is too high. WOW! What a difference. The setup runs like a raped ape. On Saturday I got Bahamas, Hawaii, Netherlands and Italy on 10m. Sunday in the SS contest I got almost everybody I called on the first shot, lotsa compliments, and NO SWR icons. It even works on 40m!

10, 15, 20 and 40 are great. 2 and 440 are typically so-so. 6 seems OK too. Very happy. And if anyone needs a recommendation on mounting on a big SUV I would say the left front hood, believe it or not.

There is the small 2.4khz filter then two larger slots for aditional optional filters . the one next to the 2.4 khz is for the 500 hz filter , install the 300 hz filter there. this means you have to turn on the 500 hz filter in the setup menu and selct the 500 hz fliter to use this 300 hz filter. the last slot fartherest away from the 2.4khz filter which going this direction is toword the front of the radio install the am filter there and in the setup filter turn on the 6 khz filter.The 300 hz filter will work in the 500 hz filter position , at least in recieve i have not tried xmit i dont have ant setup.

73's and enjoy Gene WD5FDL

p.s. The 2.4 khz is toward the rear of the radio in relation to the other slots.and the am goes closest to the front and the 300 hz in the middle .

2020. Receiving SW bands via ATAS100

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-22 23:01:36 UTC
From: David Feldman
Topic: 2020 Message: 2020

In my early experimentation with the FT100 and ATAS100 it seems it only knows how to tune when transmitting. Is it possible to move the antenna setting while receiving? I just picked up an AM filter and have in mind to receive SW broadcast; having the ATAS resonant would I suspect help, and clearly putting a carrier on out-of-band is either impossible or illegal or both.

Is receive adjustment possible?

Dear Pres
How are ya Maybe you can help me. My name is Mark KC2ELT and I am studying for my general,. I just passed the 13wpm code test thank god. I want to buy a ft100 with the antenna system. I have a 1999 Expedition. Anything at all I should
know. I am new to amateur radio but the installer is also a ham from a local two way radio dealer. I happened to see your post about the expedition. I promised
my wife it would be somewhat low profile. Does the ats100 antenna meet that criteria or what help can you offer me
Many thanks
Mark

writes:

<< I promised my wife it would be somewhat low profile. >>

A Hams Promises, ha ha.. "The check is in the mail", "Trust me" etc... I
will tell you a few secrets since you are a new ham.
Everything costs 50 bucks or a friend lent it to you.
Establish a separate checking account for those "ham needs".
Get $25 savings bonds deducted from your check and mailed to your PO Box (for
qsl purposes) you can use these to finance your new dollar consuming hobby.
There are more but my wife is in the room... ;-)

Anyway, if you want a clean install, try to mount the antenna in the rear
(this is an astetic location to most females). The Hood mount thing is out of
the question! That will certainly get you thrown out!! I Try to find a
suitable location in the rear where you can mount the ATAS. I would suggest
having a local welder make you an L shaped bracket out of square tubing
(preferably some light material like aluminum stock) which fits into the
trailer hitch square hole (you do have a hitch? Dont you?) Make that rise
enough so that the rubber boot of the antenna almost clears or actually
clears the roof (if you are daring). Also have a threaded lug on the mount
where you can mount a short stretch of ground strap from the vehicles chassis.
At the top of the mount you would have a plate welded with a hole in it for
the 239 connector. This is a removable setup which may cost you a few bucks
up front but it is easily removable, will fit in the cargo area and will make
the wife happy. If I had and Expedition with a hitch, this would be the best
option by far.. Good Luck Richy

PS, remember to keep the Ft100 away from the vehicle computer, for noise and
possible damage concerns! Some cool things you might want to add:

Cassette adapter with mono plug at the end to pipe the FT100 into your stereo
deck. Works great when using the DSP since that circuit saps the audio down
making it hard to hear when mobile, this also affords you the ability to
tailor the rx audio with the bass and treble controls and the dolby circuit
for noise reduction, works super in my Firebird.

Another way to go is the rf adapter with a mono plug adapter, you can tune
the stereo to an obscure FM freq and pipe the audio in that way too. The RS
adapter I am told sucks so try a few stereo shops to find a good one.

Get yourself a zip drive case, the FT100 fits right in there with the mic and
a few accessories ($29) from OfficeMax. You can sling it over your shoulder
when you are finished yakkin..

If you need any more seasoned ham help, drop me a line.. Good Luck with the FT100!! Richy

And if the wife ever drives the thing, you'd best account for what happens when she drives it into the garage or a parking structure.

You do have one possible alternative. Find a way to plant the idea that she wants to be a ham also (in such a way that it's HER idea). If you do, there is a possibility that she will pick up a book and pass the test (usually in short order), at which point she'll begin to have a different perspective on the appearance of the antenna. There is also the possibility that she will end up with an Extra class license in 3 months and install a "Texas Bug Catcher" on her own along with a few other antennas and start chewing you out for messing up her settings on the FT-100.
While my wife (KC8NEW) hasn't fallen over the edge yet, she did scarf up my VX-5R right away and I haven't seen it since. She's also starting to ask about all the equipment I have, so I may only have another couple months of ham bliss left.

2028. FT-100 "Deviation Problem" In The Center Of The 2 Meter Band

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-23 20:55:12 UTC
From: WW4WJD@xxxxx.xxxxxxxxxxxxxxx)
Topic: 2028 Message: 2028

Fellow FT-100 Enthusiasts,

I am writing this e-mail on behalf of Mark Suhs, W9WGN@... (a FT-100 list member) who is getting ready to depart from his home in Florida to the "cold" of north for the Thanksgiving Holiday.

Additionally, as a newer amateur, I am getting ready to buy a FT-100 shortly, for Christmas.

I was talking to Mark today on 2 meters on his FT-100 and several of us on frequency noticed a problem with Mark's FT-100 audio transmissions.

Some Background On Mark's FT-100:

1. This FT-100 is only 2 weeks old.

2. The FT-100 manual has been read "cover to cover" by Mark, who came out of an Icom 706. Additionally, Mark has a good mobile HF technical knowledge :)

3. Mark has this rig mounted in a Geo Tracker, wired directly to the battery. As so far, we have ruled out a wiring problem.

4. Antenna: Mark is using a Diamond dual band mobile 2m/440 antenna, and for HF, a tri-mag mount utilizing quick disconnect "Ham Sticks".

Here is the specific problem:

Focusing in on (2) specific MENU settings:

Mic Gain: Currently set to a factory default setting of "50".

FM Deviation: Currently set to a factory default of "2.5".

The FT-100 sounds excellent on all bands but the center portion of the 2 meter band.

On the 145.130, here in Orlando, Mark sounds best with the two above settings set to 40 (Mic Gain) and a 2.5 (Deviation).

Now, using the settings of 40 and 2.5...

On the local 146.730 repeater (located in the same physical location as the 145.130) the FT-100's transmit audio sounds "fuzzy" yet fully readable.

On our local 147.285 repeater, the FT-100 sounds "excellent".

The specific problem with the FT-100 is our 146.820 repeater. The rig sounds "horrific". Better described as sounding as far as 10-20 kc's off frequency. The audio is muffled and audio is not able to be understood in an way.

On the 146.820 frequency, about the same distance away from the repeater as Mark, was a fellow amateur running a FT-100. That amateur noted that his FT-100 was set to a mic gain of "40" and a deviation of "2.5". That amateur sounded fantastic in audio quality.

Background: The 146.820 repeater proprietor stated that the repeater's notch filter's are set very "tight", whereas the repeater allows the user to deviate very little to none.

Summary: This FT-100's transmit audio sounds great on all bands except in the center of the 2 meter band.

Question:

Are there any other MENU settings that Mark could adjust to make the rig's audio sound better in the center of the 2 meter band?

Has anyone on the list experienced a similar problem?

Mark will be leaving for vacation tomorrow and will experiment further with the radio while up north.

I would be most appreciative if when you respond to this list posting, that you could CC: Mark Suhs, W9WGN (a list member) at W9WGN@....

Thanks In Advance For Your Assistance :)

Joe:
I think the only way you're going to sort this out is to check the rig out with a services monitor to see if it's in fact on frequency and set to the proper deviation and to see if there's any difference in those parameters across the band. Short of that, I'd suggest testing it simplex with another radio on various frequencies across the band.
The problem is that you can't compare signals from one repeater to another unless you know the repeaters are all setup correctly. It's possible that his radio is in fact off frequency a bit and that some repeaters are a bit off in the other direction causing more of a problem with them than with others (even though another radio may be fine with all of them and despite the claims of all the repeater owners that their machines are withing one part in 10 Trillion). You won't know that however until you can determine what's really going on, which will take some test equipment or some other controlled test.
My guess is that his radio may be off frequency, but if that's the case, it would probably be off all the way across the band. It's not likely that there would be a problem in the middle of the band only.

Hi Joe,

I have had my FT-100 for some 9 months now. Most of the people that I have talked to that had FT-100 have reset there gain to between 35 and 40. However this is still not low enough for AM work.... It needs to be <20 for AM or it really sounds bad. I have mine set to 35 and hold the mike about 6 inches away when working AM. For the other modes, close talking the mike is fine.

I'm using my FT-100 with the Heil Proset and the funky AD100/AD1-Y adapter rat's nest...
I went to adjust the MIC GAIN for "three or four" ALC meter dots (as specified in my manual). I *always* have six or seven dots. !Even with the MIC GAIN turned down all the way to ZERO! And at that setting there's still RF output (seemingly unchanged).
Every other radio I've owned, MIC GAIN=0 mean zero. zilch. etc..
Has anyone else noticed this? I've never received any complaints about audio quality, but then I also work mostly CW.

Thanks for your observations/comments,

Scott Townley NX7U

My FT100 is about three months old. I have it installed as a mobile unit in my car. Periodically it will display the "high SWR icon" and cease to transmit. It continues to receive. I cannot find any reason for this to occur. It will reset itself over time.

I operate primarily on 432.1 USB although I very infrequently use a simplex FM frequency in that band or the VHF range. Any ideas of what is going on?

Looks like it's time for the trip back to Cerritos. While it's there have
them update the shielding mod for the same problem occurring on HF. This is a
new mod within the last two weeks direct form Japan according to the service
manager. Anyone experiencing the random SWR icon happening on HF should get
this one doen. Mine has been back three times for this problem and it will
return again for this mod.

Good Luck,

It's the other way around with me. I'm using the HC4 insert in my headset and I've had to INCREASE the mic gain to 90 to get the same output as I do from the supplied hand mic which uses a mic gain setting of 30.

I can't try the zero setting at the moment because my radio is still at the repair shop getting the 70cm fault fixed and the am and cw filters fitted.

By the way, My radio doesn't seem to put out the full 100 Watts. It's more like 80 Watts. I have asked the service people to confirm and correct this situation while they are working on the radio. Does anybody else have the same problem?

Just posted some pictures of my installation in a
1995 Chevy Tahoe(in the files folder atas-100chevy) . Its only a few days old but so far
"wow" does it work or what!!!!
Waiting for a duplexer so I can remove the tru-glass
2/440. The ATAS-100 has to work at least as well!!!
see you on 10mtrs

In my opinion, ANY thruglass dualbander will work better then the ATAS.
Including the little 18" cellurar look alikes.

Sorry, but I think you're wrong. More or less all thru-glass antennas are nothing but garbage. I have just returned mine after having tested it during 3 months. When it come to compromising, the ATAS-100 when roof mounted with a good ground connection is rather better than a thru-glass. With the thru-glass (from US-based Pro AM) I did loose about 20 dB compared to a fixed mounted dualband antenna. So now I will drill one more hole and use a fixed mounted.

I use a ATAS 100 on my motorboat, but it is not working very good. Is there anybody who has experience, especially what (earth) weight do i need,etc.
I used it for a few days and it was so corroded, that it is not possible to remove the upper part.

Dear Gerd and Michael,
Here are a few thoughts on your 2/440 + the boat operation.
1) 2/440. I use a diamond dual band mag mount for these bands. The performance is wonderful and is cheaper than buying the duplexer to use the ATAS-100
for these bands.
2) For boating operation, you might try adding RF grounding from the radio to a through hull. Also, the antenna must have as good a ground as possible.
How was the SWR when it DID operate?
73,
David Klein, KE8QM
p.s. - I made 40M contacts in the Nov. sweepstakes from OH to CA. (till the ATAS-100 locked up) When it works - it is a nice system.

Mike,
KF6SWI >>

That's because you used a "garbage-brand" glass mount antenna. Try the Larsen KG2/70 model. I have used them on three different vehicles, and have compared each installation to a mag-mount Larsen dual bander on the said vehicle. The Larsen glass mount was on par with the mag mount each time.

However, I will say, that the performance was less than that achieved with my Diamond SG series antenna. Like the old saying, "you get what you pay for". The Larsen KG 2/70 antenna is not cheap ($90 or so).

Guys:
I use a small dual band base antenna (I think a Diamond X-50) that I fitted to a convetional marine ratchet type antenna mount. It's mounted on top of my radar arch and works great. I get occasional questions about the radials from people, but in general is fits right in.
I agree with David that for HF you'll need as good of a ground as you can get. However, in fresh water that can be a problem and you may have to run some copper strap the length of your bilge with a strap going up inside to where the antenna is mounted. In any case, it should be bonded to the engine and electrical grounds. Hopefully you don't have noisy gas engines or other electronics that produce lots of HF noise.

Recently my ft100 has been flagging the "high swr" icon when the radio is used to transmit in the FM portion of the 10 meter band. Antenna and feed line check out "OK". Radio performs normally when operated in the sideband mode. Comments? Suggestions? Thanks in advance and 73

I have downloaded your pics to my HD for more study [actually to drool over]. I was pleased to see application on a Tahoe. We will be ordering either a 2000 Yukon or the XL version in Jan-Feb. If you have time, I have a few questions about your installation.

1. Is the ATAS mounted on the driver's door because of the engine computer placement?

2. What gauge wire did you use from the battery to the FT-100?

3. Do plan to remote the head and, if so, where would you mount the body?

4. In the retracted mode, how tall is the ATAS [garage ceiling implications for me].

I have an FT-8100R which I currently intend to hang on to. I like its scanning speed and it remotes nicely.

>Waiting for a duplexer so I can remove the tru-glass
>2/440.

If the glass mount is not "bothering anything", maybe leave as a future APRS antenna. I'm using a Kenwood D7A & a Garmin GPS III+ for APRS and will probably install a dedicated APRS antenna along with an auxiliary GPS active antenna. Then there is the cell phone... Thing will look like a porcupine.

Thanks for your time.

Jim...try the ferrite donut trick.....get a ferrite ring about 1.5 to 2 inches in inside diameter. Run coax through it three times right at the base of the antenna. This has worked for several people. Dale KC2PZ

2050. Mounting Of An ATAS-100 On A Motorboat

Yahoo group: FT100 (1998 — 2000)

From: WW4WJD@xxxxx.xxxxxxxxxxxxxxx)
Topic: 2050 Message: 2050

Hi Gerd,

I have the ATAS-100 and use it as a base antenna on the rear porch of my home, in a deed restricted area.

With a motorboat application, I cannot imagine you attaining a good ground with all that fiberglass to contend with.

Yaesu manufactures a ATAS-BK, base kit for the ATAS-100. I use it and have had good results with it.

The Base Kit is composed of a metal ring and ground radials. Therefore, the BK is the antenna's ground when the antenna does not make contact with a metal object. This serves as an answer for someone who wants to mount an antenna on a "wooden back deck" for example.

The ATAS-BK sells for about $90 and would help your signal immensely.

BTW, you need to be very careful when weatherproofing the ATAS-100, as it has both moving internal and external parts.

Warm Regards,

The problem you are experiencing is a result of oscillation in the final amp
due to improper shielding. Mine has been to Cerritos three times for the same
problem and is currently in route for the fourth trip. According to the
Customer Service Manager, John Lynn, there is a fresh mod just received from
Japan that is supposedly the cure. Keeping fingers crossed. Find your box and
ship. Good luck.

2052. Odd shift

Yahoo group: FT100 (1998 — 2000)
Date: 1999-11-30 05:02:10 UTC
From: Brian Short
Topic: 2052 Message: 2052

Greetings FT100 Afficianados.

I am happy to report that the FT-100 that I purchased from Ross Distributing Company ($1185) arrived and has been working VERY well. While on Thanksgiving Break, I drove across Kansas. From Kansas City to Elkhart Kanasas (6 mi. from CO and 6 blocks from OK) the radio performed flawlessly. I worked Melbourne, Munich, and Croatia. I was also able to talk to my Father at the destination for many hours. I have the system mounted in a 1993 Taurus SHO and the ATAS-100 looks very aesthetically pleasing using the Comet GR5M trunk lip mount.

I have only one question. I work several 6 meter repeatrs, some of which have a 1.7mhz split (MACC standard), some of which have a 1.0 mhz split (ARRL standard), and some of which have a .5 mhz split (CA standard) I am unable to determine how to get the radio to support this. Whenever I change the shift (50 MHZ repeater shift) it changes the shift on the memory channels. And when I run the split operation, it uses the alternate VFO for EVERYTHING, not just the memory channel I intended. (In other words both of these settings are global)

Is there a way to store an odd shift in a memory channel?

Thanks for any help, I really enjoy the list! It helped me make my decision to buy an FT-100. I hope to put up pics on my website soon, and will advise.

From: Mark Levine, D.C.
Topic: 2054 Message: 2054

Would someone tell me what type acceptance (now known as type certification) that the FT-100 had to go through to be marketed. I remember when the rig was announced, a disclaimer was at the bottom of the ad that the rig had not yet been type accepted by the FCC. I have tried to research the regulations on the FCC database and cannot find the reg as it applies to amateur radio. Can someone help me? de Doc

Question about the base kit. What's the length of the radials, what's it come with, etc? If anyone has a jpg of it they could post, I'd appreciate it. Due to homeowner's restrictions
I'm forced to use the ATAS-100 inside my attic. It's working ok, but I can't get the SWR down on 40 meters. I've tried ferrite cores/rings, no good. I've currently got them on the cable below the antenna, on the pigtail behind the rig, and even on the mic cable, but still can't get it to tune.

Thanks!

The radial kit is a bust! It was designed to help with the pattern on 6M, 2M and 440. It will not do a thing for HF operations(At $165CDN its also not a very good deal!).

I mounted my ATAS100 on a inverted electrical utility box using a SO239 barrel connector and run radials from the box-it works well, but the radial kit will not help at all!

Hello
I am new to ham radio . I have been licensed a year now and am going for my
general written next week. I plan to pass LOL . I need some good advice.
I have enjoyed working 10 meters and have been doing alot of listening
on the 40 and 20 meter bands. I want to purchase an hf mobile and have
been seriously considering the ft100 with the ats100 antenna system. Being a new ham and
not being the most technically oriented person am I going for
too much of a radio. The long in short is that I want to mount it in
a Ford Expedition and only want one antenna or 2 if necessary for all bands.
I would really like to purchase this radio this week so I could use some
advice on where to order it HRO etc. My main question I guess is this
radio too advanced for someone that is fairly new to the hobby or am
I shooting in the right direction. The people I have met so far in
amateur radio have been very helpful but no one that I have met operates
hf from the mobile. Any advice would be greatly appreciated
Thanks loads
Mark

The FT100 is super! I have mine since the 4th of Aug. I also have the
ATAS100 and it is also great. There are some minor quirks with this combo,
but if you can locate the latest serial number available, IMHO you are better
off. The radio just dropped 100 bucks so expect to see them around +/- $1199.
The ATAS can be had for under 300 bucks also. I have a 9E serial number
meaning 9= 1999 E=May (5th letter=5th month and so on). The only trouble I
had was rf grounding so plan your installation well. Mount the rig in a
suitable location and well ground it, make sure you attach the power leads
right to the battery, Make sure your ATAS from the boot up clears the roof of
the truck. You may also want to add in a nice size speaker or opt for a
cassette adapter with a mono plug to pipe the audio thru your stereo..Good
Luck, this radio is great!! Richy

Mark:
In my opinion, there is nothing such as a radio that is "too advanced".
All of us, even people with many years in Ham Radio (I'm going on 34 years
now) have a learning curve to deal with for any new radio. You should pick
a radio that has the size factor and features you want, that you feel
is from a good manufacturer and retailer, that others are willing to
reccomend and of course that is within your budget. In my opinion the
FT-100 is the best mobile radio available today and you simply can't go
wrong buying one at this point.
As far as antennas are concerned, I think the ATAS100 is a comprimize.
If you can only have one antenna and it can't be too big, then it probably
is a good choice. However, you will have much better VHF/UHF operation
from a good dual band antenna, particularly if it's mounted in the center
of the roof, and you will have better HF performance with good single band
antennas or larger tuneable ones. If you don't mind the size, the
"screwdriver" antennas work great. Also an automatic tuner such as the SGC
or one of the kit versions work very will if you have a large enough
antenna connected to them. In my case I use an SGC-231 and a stainless CB
whip mounted fairly high on the back of my truck. With an Expedition you
certainly have adequate realestate to mount some good antennas.
Your success will also depend on a good installation. When you get to
that point you may want to ask for advice again.

2062. RE: ATBK

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-01 21:11:44 UTC
From: James J. Caperelli III
Topic: 2055 Message: 2062

I saw one in the local Ham store a few weeks ago. The package itself was no longer then about 3 or 4 feet. It looked as if there were several or more rods and a ring that the rods attach to. It appeared that the ring somehow attaches to the base of the antenna. I am doing all of this from my memory, which, well, take it for what it is worth. So I would assume without actually knowing any more about it, that if you had a good 4 feet or so around the antenna, it should work. FYI the package I saw was just clear plastic containing the components stapled to a cardboard header.

It also did not look like any rocket science was in the package. So you may want to try some sort of counterpoise of your own.

I have a big problem on FT100 purchased past week.
FT100 absoletely dont work in mode TX with packet at 9600 bps on
430 Mhz. frequency.
In RX , no problem.
I have tested 3 Tnc and modified level output without results.
I have checked and re-cheked parameters in the functions on
FT100 and all seem in order towards manual instructions.
I changed several times FM/deviation.. no positive results.
I'm extremely annoyed for this problem because I have bought
FT100 just for this service (9600 bps).
Somebody have anny suggestion to resolve this problem ?
Thanks in advance,

It seems to me that when I was reading the info on the ATAS/ATBK combo, I saw something about using it in conjunction with a metal handrail. It stated that there were three radials one each for 70,2,6 meters, and that the antenna saw the railing as the ground for the HF portion of the antenna. If someone will correct this if wrong, it would be appreciated. Thanks

From: J & D Schnoor
Topic: 2066 Message: 2066

This probably has been answered before, but can anyone advise me of the following:
1) How fast does the FT-100 scan in the memory mode for FM channels?
2) How does the out of band reception compare to other amateur transceivers in the N-FM mode?
3) What are "must have" options if I would purchase this unit?
4) What are the best web-sites to learn more about this radio?

2070. Extra Ham bands???

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-02 11:57:21 UTC
From: JohnGP
Topic: 2070 Message: 2070

I've had my FT-100 for a couple of months now and all in all I'm very pleased with it. there is just one thing that is causing a bit of confusion and I wondered if any of you out there were having the same 'problem'

In my manual is states:

9. UP/DOWN Keys
Pressing one of these keys momentarily will cause the frequency to be moved up or down by one Amateur band.

Which seems fine and very clear, but on my FT-100 I keep getting extra amateur bands, for example this morning they are:

1.8, 3.5, 7.0, 8.4??, 10.0, 14, 18, 21, 24, 28, 50, 80??, 145, 432.

So today I have 8.4 and 80Mhz as amateur bands! I say today because the 'extra' bands seem to change every time I turn the thing on. Anyone have the same 'problem' or an explanation?

JohnGP

JohnGP >>

Hi John,

There are two volitile bands which the FT100 will display outside the
normal ham bands. If you tune anywhere above or below a typical ham band, the
FT will store the slots as you go up or down. As you change, the rig will
change. For instance, I was fooling around below 50 mhz one day and above
900mhz so the rig displays all nine hf bands plus 6m 2m and 70cm and squished
in there is now 46mhz and 900mhz. This changes as you tune around... Richy

2072. ATAS 100

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-02 16:30:25 UTC
From: Allen Yoder
Topic: 1314 Message: 2072

Dear Sir

I bought one of the base kits you refer to. I too was having trouble getting low swr, but my problem was on a truck that I was not willing to drill a hole into.

The base kit did help, did the most good for six meters but it was not a cure all. Since then I found an antenna mount that solved my problem. While it does require that I drill a set of holes in the vehicle they will not be visible to the average person. At the time I sell the vehicle I will remove the mount. (IE: the holes are inside the fenderwell)...

After getting a direct ground to the trucks chassis all my antenna woes went away.

If you make me a reasonable offer I will ship the base kit to you...

My suggestion to you is to get some large pizza pans, cookie sheets, or just the largest sheet of roofing tin you can place in your attic. Use this as your counterpoise for your atas100..

2073. FT100

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-02 16:40:30 UTC
From: Allen Yoder
Topic: 414 Message: 2073

The manual for the FT100 has several areas were it is kinda 'grey' or less than accurate.
Instead of stating that:
Pressing one of these keys momentarily will cause the frequency to be moved
up or down by one Amateur band.

The manual should have stated:
Pressing one of these keys momentarily will cause the frequency to be moved
up or down to the next major wavelength of spectrum..

It changes because of where you were in the vfo when you start band hopping.

On a side note: Read the sections of the manual about the ATAS antenna, at the beginning and end of the book. They contradict each other, at least in my manual.

2074. ft100 scanrates and other feathures

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-02 17:51:43 UTC
From: Allen Yoder
Topic: 2074 Message: 2074

I have not actually put a stop watch to the radio but the scan rate is NOT fast. About 1 sec per memory channel.

The NFM non ham reception is just fine and is comparable to any other ham ((Transceiver)).. You are not going to compare with a high quality general coverage receiver.

The WFM is a horse of another color. While most WFM broadcast are tunable the audio quality and audio volume of the signal are hit and miss. Example Channel 8 TV audio is loud and clear but channel 4,5,11 are poor. In the Dallas area they all transmit from about the same location with similar power levels.

Allen:
Since TV audio is transmitted FM, the audio level is dependant on the transmit deviation and not the received signal level. Any differences in the audio level between channels would not be the fault of the FT-100. Or did I miss what you were saying?

Chuck

2076. Antenna for 80 & 160

From: Jack G Bilow
Topic: 2077 Message: 2077

Greetings fellow FT100 owners!
I have a question about the receive capabilities of this radio. I have been learning the radio for two days now and is 800 MHz receive really in there? It is does not seem to work in my radio. I do not hear a peep even on an outdoor antenna. Is there a fix or something to get this portion of the spectrum or is this another feature that really does not work? I am not trying to beat down the radio...I waited almost 2 years from inception to the purchase.
Also, I am experiencing clicking when the receiver goes from 6m to 2m and 440. Is this a relay of some sort or did I miss a command to stop this click?
Thanks for your time and assistance.

2078. FT100, ATAS - questions

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-03 03:55:41 UTC
From: David Feldman
Topic: 2078 Message: 2078

1. If I leave the HF/6 ATAS mode (1?) enabled, and attach a non-ATAS antenna (potentially with DC open or DC short), will that damage the rig? (I didn't do this, but want to know before I would try, to avoid accident - I wonder if the rig passes power to the antenna with some kind of non-destructive current limiting).

2. Can the ATAS antenna be adjusted in receive mode, as in order to receive SWL signals on non-ham HF freqs?

3. The fidelity on NBFM is TOO good - piping the output of the FT100 into my car stereo (thru a cassette adapter) CTCSS tones are really loud - enough that the audio band-filter on the stereo can't reduce it enough. Is my only recourse to install some small high pass filter on the AF out?

Welcome!

I have been licensed a year now and am going for my
> general written next week. I plan to pass LOL .

Well, if you can't pass laughing, pass any way you can...

I need some good advice.
> I have enjoyed working 10 meters and have been doing alot of listening
> on the 40 and 20 meter bands. I want to purchase an hf mobile and have
> been seriously considering the ft100 with the ats100 antenna system.
Being a new ham and not being the most technically oriented person am I
going for
> too much of a radio. The long in short is that I want to mount it in
> a Ford Expedition and only want one antenna or 2 if necessary for all
bands.

I have an Expedition installation. It works GREAT. The only place I could
find due to height is opposite the broadcast antenna ahead of the driver on
the edge of the left rear part of the hood over the engine. Looks dorky but
you can watch the thing go up and down.

My installer grounded the coax to the fender insode the engine compartment. Of course you will want to be cautious of cable routing away from hot or sharp stuff, and connect directly to the battery and be sure to turn the radio on AFTER you start the truck.

You will be very happy with how this thing gets out.

NO!

Just how good can a antenna be that is 8 feet tall for 160 meters? Not Very good at all.
If you are planning on getting on the air and transmitting you will be very disappointed.
If you could make a trapped dipole it would be better. Still a full-size outside antenna is the
solution to a good RX/TX antenna that you can use without struggling.

Dear Charles,

In response to your question:Since TV audio is transmitted FM, the audio level is dependant on the transmit deviation and not the received signal level. Any differences in the audio level between channels would not be the fault of the FT-100. Or did I miss what you were saying?

I am not an engineer, so I might not always be 100% technical correct. Also note that the answer I was stating was my opinion of the performance of the Ft100 to receive non ham signals. You know about opinions. We all have one. I sincerely hope mine does not rub you the wrong way. That was NEVER the intent.I will try in my non technical way of explaining what I meant with more details...

In regards to the TV signals, I don't have to adjust my TV's volume level when switching from channels 4/5/8/11. They are all pretty close to each other, except maybe during a commercial...But that's getting off the subject..

So if I tune the Ft100 to the audio portion of the TV signal, should not the audio be again, pretty close? I have to turn the volume to near 100% to even hear some of the TV stations, and then it's just barely audible.. Others are just fine and have all the audio I need..But they are many mhz apart.

My non technical mind says that If the TV does not have a (BIG) volume difference between stations the FT100 should not either, were it designed to be a TV audio receiver... But the FT100 is not a TV audio receiver, it's one heck of a Ham rig with the potential to receive some cool non ham signals also.

Will it do the job as well as a receiver that is optimized for a task? IMHO the FT100 makes a so-so wide band receiver. But again, it might perform better if I had a antenna that was optimized for each non ham band I tried to listen to...

Hope this clears things up... Your friend Allen Kb5gme...

Rather then run a vertical why don't you string a dipole in the attic? Just make it as long as you can then feed it with twin lead or ladder line to a tuner. I know you did not want to go the tuner route but this way will get you the most rf to the and out of the antenna. If you try to use a loaded vertical or short loaded dipole your efficiency will be just about nil and you coils will have to be so big that you will have very little band width. 73 Mark AB0HJ >From: "Jack Kovar" >Date: 12/03/1999 8:46:42AM >To: FT100@onelist.com >Subject: Re: [FT100] Antenna for 80 & 160 > >From: "Jack Kovar" > >NO! > >Just how good can a antenna be that is 8 feet tall for 160 meters? >Not Very >good at all. >If you are planning on getting on the air and transmitting you will >be very >disappointed. >If you could make a trapped dipole it would be better. Allen:
I'm wondering if you have your radio set to receive AM transmissions for some of those TV channels. Since there is often a small AM component to such FM transmissions it's possible that in AM mode with a strong signal and the volume turned all the way up that you would hear something. Otherwise, my technical mind is lost for an explanation. I'd be surprised if there's something with the radio that would cause that much of a difference in audio level over different frequencies since what's really happening is that the signal is being mixed down to a common IF frequency and passed to the detector. As long as there's adequate swamping of the limiters, the audio level should depend entirely on the signal deviation.
Humor me and check the receive mode you're using on those frequencies.

Date: 1999-12-03 21:28:42 UTC
From: Allen Yoder
Topic: 1747 Message: 2085

I forget the exact frequencies but if memory serves me channel 4 TV audio is something like 65.750 mhz channel 5 is 75.750 mhz and channel 8 is something like 175.750 mhz and channel 11 and 13 are in the 200 mhz zone... If you ask I will go look up the exact frequencies I am using and report them back to you. Have you tried to receive TV audio in your area? What were your observations?

I am most certainly in the WFM mode at all times. My ft100 is just not nearly a sensitive to 65-75 mhz or 200 mhz as it is to 175 mhz.

I mean I could borrow my dad's signal generator, get him to explain to me how to set it up and all.I already know that my FT100 is most sensitive on the ham bands and that in the non ham bands it will most likely receive the bands that are multiples of the rf bands is was specify designed to receive. Something to do with being resonate on a given frequency..

I know the IF and all that plays into it. To change the subject entirely, how many of you like AM and are you entirely happy with the AM transmit of your Ft100. Did you change anything to make the rig do better than stock out of the box?

2086. Packet 9600 bps

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-03 17:50:10 UTC
From: Daniele
Topic: 2086 Message: 2086

Hi to all, (DG8JZ Hanno, DK1BN Walter, DL1GVM Gerd)

EUREKA ... at the end 9600 working with 9600 bps in 430 Mhz. !!!
Thanks in particular to Walter that advising me about menu parameter
n. 28 AFSK Level In effect here was major problem (in my FT100 was
at 50) when changed to 100 all OK. I dont know because level AFSK
influence 9600 mode is really incomprenhensible !
But....another problem coming up ..! In RX this time..!!!
If I try to connect a station (digipeater or gateway) on same
theoretic frequency, my TNC have great difficult to demodulate
arriving signal.
I compelled for going down in frequency about 2,1 / 2,3 Khz
in comparison with frequency where usually working correspondent
station then all working perfect.
This is a very strange thing...!
And yet, with others RTX that I using coupled with same TNC
(430 Mhz i.e. ALINCO 599/FT8500/IC3210)
I have not above mentioned frequency problems.
My tests changing "DIG" in 5K up to 50K no bring positive results.
This is a very strange thing...
Anyboy have an idea ???

2087. VHF amp

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-03 22:02:34 UTC
From: Mark Levine, D.C.
Topic: 2087 Message: 2087

I have an extra VHF Engineering (30 in/140out) VHF only amp that I am considering putting in line, driven by my FT-100. I am using a Comet duplexer (706) into the ATAS-100 for HF/6/2/440. I plan on putting the amp between the duplexer and the rig (I haven't checked the power rating of the duplexer yet) but I am wondering if going on 440 will key and/or damage the amp. I've never worked 440 from the car and probably will rarely use it.
Any feedback will be appreciated.

440 most likely won't key the amp. I don't know if it can damage the amp.
However, the amp WILL make 440 deaf as a doorknob.

No problem Mark.

When you operate 2m, switch on the amp and turn the ptt switch on (if it has one)and all will be well.

If and when you use 440, simply turn the amp off or hit the ptt switch to bypass mode and all will still be well.

It will transmit and receive as good as ever on 440 through the relay contacts in the amp. The will be no loss at all on tx or rx. Don't let anybody tell you otherwise.

Go for it.

Topic: 2087 Message: 2094

Alek, that's very interesting. I'm not trying to start a flame war, but I've pulled out my notes on the test measurements achieved on a variety of 'brick' amplifiers.

Test frequencies where 146.000 and and 440.000 MHz. I played with other frequencies too, but these are the ones we logged. The other frequencies made little difference.

Target signal on a Yaesu FT-847 with a Diamond MX-2000 Tri-Plexer. Connections were in the following sequence; rig, triplexer, brick, signal generator. Therefore regardless of which frequency the brick was designed for, the results would be easily distinguishable on both ports of the 847.

Voltage at the 847 was NOT measured directly (I didn't want to open it,) So, S9 was used as the baseline. The signal output required to deflect to S9 was equal on both bands (Sheer luck I suppose, I have no idea if most multiband rigs will be this close)

Therefore it follows that if 'something' is thrown inline that has a different effect on the 2 bands, it will show in the meter deflection. i.e. inject a signal on 2m to an S9 deflection, inject the same power signal on 70cm and increse signal as necessary to achieve S9, the power difference being the -db.

All units lost appx 1-2db on their inteded frequency of use simply by putting them inline
Here are the results for their 'unintended bands' of operation:

VHF Mirage 2516g appx -40db
VHF Mirage 5030 appx -43db
VHF RFConcepts MaxAmp 45 -30db
UHF TenTec 410 appx -6db
UHF RFConcepts MiniAMP 440p -3db
UHF RFConcepts 4-310 -6db

Of interesting note, the ones with the least signal drop have no preamps. Which really shouldn't make a difference, because when the amp is off, the preamp is bypassed. Just an interesting observation.

I know this 'test' isn't completely scientific and is not even a very representative sample of everything out there but its what showed up for me.

Hi,
I sure this has been asked several times, but can anyone tell me if the atas
100
works well with a comet k-400 mount. I already have the mount with a 239
adaptor
and I was also thinking of putting it in the front of my van since the rear
will not
accept a mount due to its construction.
Thanks Mike AA8JI

2096. ATAS-100 & Ft100 etc

Dear Sir,

I don't have a comet k-400 mount or even know what one looks like. I do have a ATAS 100 and ft100 to go with it. I had to try several mounts myself before I got what I wanted. Your mounting the Antenna at the front of the vehicle may very well be a extremely good idea. It seems from my experience that the antenna works better the closer it is to the center of the vehicle.

The number one observation I made with the ATAS100 is that RF ground is everything. If you have it all is well, if not it wont work... I suspect your comet mount is designed so that you don't have to drill any holes into your vehicle. (great idea) But you need to get an RF ground. Get some braided wire and run that to a solid ground and with the shortest run possible goto the ground of your comment base. If you still have some tuning problems remember that RF ground and DC ground are two different things. Try improving the ground at the radio end as well.

Does your comet k-400 have the physical strength to hold the Atas 100 at 80 mph? After setting up your mount remember that the wind is going to use the vertical height of the antenna as a lever to try and undo it. At the best if your mount fails you will dump your $300 antenna of the side of your car and drag it by the coax. It could become a missile and go through some other cars windshield. This would be bad not only for you and the poor victim in the other car but the hobby in general. After setting up your mount evaluate it and keep very close tabs on it at first. After that I still recommend a monthly inspection of the mount, if not more often. Remember the wind is going to work on loosening the antenna everywhere you go.

Lastly in the shared files area of the web site that supports this email group there are many pictures of FT100 and antenna installations. You can get some idea's there.

Hope this helps,

I have a 1993 Explorer. I mounted the antenna to the back hatchback door right above the passenger side tail light. Mount I used was an older Comet heavy duty mount, can't remember the model, but the K400 is comparable. My mount attaches to the inside of the door with 5 large hex type screws. Did a test drive up to 85 mph and the ATAS hung right in there.

Hi All
I was just wondering if anyone knows of a computer program
that is around so I can store all the vhf uhf,6m and 10m freqs.
I have about 150 differnt freqs in memory

I know there is a interface cable for the ft100 that lets you
download info from your computer to the radio, but never have seen
a program for it.

believe me it's a royal pain to have re-program all the memories
after having to take the radio back a getting a replacement

Thanks

Yes I do. I use it to tune a standard G5RV (100ft center fed, 30ft
of open wire line) on 75, 40, 20, and a interlaced quad loop for
10 and 15 meters.

With tuner, loop tunes fine on 17m, 15m, 12m, and 10m. Loop will
also tune on 20m but it confuses the FC-20 to keep changing the
load for the same band.

I have separate loop for 6m on same spider but with different
feed line and tuner tunes that fine as well.

Tuning seems slow on 75 with the G5RV, but in usually achieves a
match. Does not tune as fast or as effortlessly as the internal
tuner in my old TS-850 did.

2111. FT100 standard SSB selectivity?

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-06 20:40:47 UTC
From: David Feldman
Topic: 2111 Message: 2111

Having just finished my first car trip with the FT100/ATAS100 (worked fine, just needed a bit more training time before trying to use the features mobile...) I am left wondering how the selectivity in SSB is defined? I expected typical 2.4 kHz (300-2700) type passband, but it seems instead the rx passband in SSB is 0-6 kHz or something very wide like that. I played receive audio thru the car stereo and I could get a carrier beat note down to extremely low tones. Turning on and setting the DSP made the passband as desired but I'm left wondering what the non-DSP selectivity characteristics are for SSB?

Allen

If I am in the car, which I usually am most of the time in the evening, I will join in on the chat. I would like to hear some other signals from those on the 100.

I also agree with some of the other comments about the band being dead at that time. I will still tune in around 7 pm and listen. If I hear nothing I will go to 14.290, which I think should be far enough away from the maritime net on14.300 and any other scheduled net traffic. If someone else knows better let me know.

Also I will check my e-mail as late as maybe 5 pm to see if anyone has any better ideas, or if something was settled on for an alternate if 24 mhz does not do the job.

P.S. Are you really serious about the +/- 10 MEGAhertz..... Hi Hi

Go to http://www.fcc.gov/formpage.html and download form # 605. I prefer the .PDF format. Print it out and read the 18 pages of instructions, get totally confused, then fill out the 2 pages you need and mail it. Let me tell you right now that I am not sure 605 is correct, but good luck.

Anyway....
That seems to be the easy way compared to the ULS system which is a typical government inefficiency. I do not why I would have download all kinds of files and then leave the Internet, install those files, install a different brand browser, then configure dialup networking to call something other than the Internet. Just to update a license. I figured you would just register then use a web form like EVIL corporate e-business does. I guess e-business companies do not have budgets in the trillions.

here is an idea 1st get a trucker cb antenna mount from radio shack
2nd widen the big hole to 5/8 inch ,3rd get 4 ea 2 inch 1/4 20 bolts
and 2 sets nuts and lockwashers for each bolt. attatch a insulated gnd wire
to one of the bolts un insulate the attatchment point.stick the isulated
part about 2 ft or so (what ever fits) into a crevice on the roof .this will
make a capacitive ground and will only work if the radio is grounded at the
radio. 4th get the appropriate coax with connector
or connector that will fit in the mount and allow a coax to be connected
(experiment ok be a ham thats the spirit) it works for me!
73's gene WD5FDL

one of the bolts

Hi, Dan.

I ended up sending my radio to Yaesu.

But, here's the poop. Look at the back cover of your manual. What's the date in the lower left hand corner of the back cover? Mine is 9902n-BY. A couple of others with 99nnx-xx seem to agree with my manual. Earlier version manuals had the filters positions reversed.

My manual says to put the XF-117CN or XF-117A in the frontmost position--nearest the front of the radio. The XF-117C goes in the rearmost position.

For all the hassle, let me recommend that if you are not an experienced (flight certified) solderer, with a fine tip soldering pencil and a good light/magnifying glass, you call Yaesu and make arrangements to pack up your radio and the filters, and send them to them and let them do it.

There are a bazillion little surface mount components very close to the filter solder pin locations. One little slip; one little drop of solder is all it takes to wipe those little puppies out. You also have a rats nest of cables (with delicate connectors) wires/connectors to disconnect and move out of the way so you can lift the board to do your soldering. It's not the most comfortable environment in which to do such delicate work.

It ain't worth the hassle or the tension.

I survived being without the radio for a couple of weeks. You can too.

Also, if your radio is still in warranty, they will include any mods that have come out since your model rolled off the production line.

2128. Yaesu Repair and Filter Installation Work

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-08 00:33:45 UTC
From: Dale L. Martin
Topic: 2128 Message: 2128

Dan's note asking about filter positions reminded me that I need to do this:

Dear Yaesu,
Thank you. Thank you. Thank you. What great service.

I sent in my Yaesu FT100 with the 500Hz filter in the wrong position (based on what the Yaesu tech had initially recommended; when, during the second phone call he admitted his mistake, that's when I decided to send it in and let the pro's do it).

My radio was purchased back in October from a private individual--he sold it because he had to sell something or his wife would not let him in the door with his newly purchased IC-781 !!

Anyway, I had no business receipt indicating that I did indeed purchase the radio and when.

But, Yaesu cut me some extreme slack. They covered all the work (filter removal and placement in the correct location, repair to some surface-mounted components (I never new I did that--AND I was using a magnifier lamp), and installed the latest mods.). I saw the $175 total on the invoice. The next morning, I picked it up prepared to write a check and drop it in the mail on my way to work when I noticed the -$175 below the total, with the notation "in warranty". WOW! Thank you! Thank you! Thank you, Yaesu. Thank you for the great service, the 'in warranty' recognition and for a great radio.

There. I feel MUCH better now. A real letter of thanks will be in the mail to them tomorrow.

73 y'all and enjoy your 100's!

Dale Martin, KG5U
kg5u@...

Well I was on or about 14.290 betweem 7:50 and 8:05pm EST. Worked a
station on 14.290 in Boise ID who was using FT1000. Not one of us.
Poor signals too.

Called CQ on 14.292.5 from 8 to 8:05pm without success.

Still open for other freq or times to try. It may require weekend -
daytime if we are going to use higher bands. Or try and slug it out on
40 in the evening. I wouldn't even suggest 75

i forgot to sayTrucker cb antenna mirror mount , they are verry sturdy .

---
also about filters regardles of what your manual says right version or wrong version of the manual the am 6 khz filter must be fartherest from the 2.4 khz filter with the 300 or 500 hz filter in the middle and setup as if the middle was 500 hz even if it is the 300 hz filter and when you want to use it select 500 hz filter (the setup for 300 hz / 6 khz option must be set to 6 khz.
this works...! and is the only way it will work if you want the 6 khz am filter and one of either cw filter. if you want both cw filters .the 300 hz filter goes in place of the 6 khz am filter
---
---
here is an idea 1st get a trucker cb antenna MIRROR mount from radio shack 2nd widen the big hole to 5/8 inch ,3rd get 4 ea 2 inch 1/4 20 bolts and 2 sets nuts and lockwashers for each bolt. attatch a insulated gnd wire to one of the bolts un insulate the attatchment point.stick the isulated part about 2 ft or so (what ever fits) into a crevice on the roof .this will make a capacitive ground and will only work if the radio is grounded at the radio. 4th get the appropriate coax with connector

2132. Heat Problems and those F menus

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-09 18:00:30 UTC
From: James
Topic: 2132 Message: 2132

Hi All,
Just messed up my FT100 memories by playing with those F settings in an effort to get the radio to cool down a bit after getting red-hot listening to 2m FM! It appears F48 (Overheat 1) is just a setting for the High Temp icon indicator and to possibly back off the power a bit.. set at 230 and F49 (Overheat 2) is a setting to stop the rig from transmitting when the heat goes a bit beyond the alarm! ie at 235 setting...

Nominal room temp appears to be around 90 odd according to my radio, so I don't know what 230 is!!!!

Also setting my radio to the 'AUS' setting in F57 and F58 forces a re-initialise of the radio, but it opens up the Cellular bands again - Although this isn't much good as the old AMPS Cellular network in Oz closes down on 31 Dec due to ACA requirements... oh well.

Had same problem with one in mobile. Once I moved the ant via use of
manual command all has been well. Remember you MUST use
the front panel up/down buttons along with ptt. The manual is not clear on
this, and at first use the up/down buttons located on mic.

Subject: FT-100 problems

Hello,
I am new to this list and want to buy an FT-100. I know of 3 people in my area that have purchased them and all three had to return them; one had garbled audio on 440, the others display went crazy and he could not reset.

Can anyone tell me if the bugs have been worked out? Any specific serial number range to look for?

I am also considering the IC-706MIIG, but think the FT-100 is more radio for the money.

Many thanks for any thoughts or opinions you can give me.

Regards,
Mark, KB2EGB

2138. FT100 Antennae?

Hi guys--
What pieces are needed to use the FT100 mobile? I'm pretty confused by all the mounting, duplexer, coax options. I -think- I want to run 10m, 2m, and 0.70m mainly. I've noticed that the FT100 has two antenna connectors. I know that there's been high praise for the ATAS-100 but I'd rather go with conventional fixed antennae for now. Do I get a dual-band and a 10m antenna and connect them directly to the FT100 or should I try to use 1 tri-band with a duplexer?
Any competent advise, especially part numbers, would be welcome.

>>

Hi Tully,

I use the Ft100 with the ATAS and a Cushcraft 270 mag mount. There have been some thoughts here that the duplexer required to interface the atas to the two connections on the FT100 was the cause of 70cm final failure although this is unproven. The ATAS works superb on HF and if push comes to shove it works pretty well on 6m 2m 440... For and all in one "pole" thats pretty good!! I use my FT with the cassette adapter converted to a mono plug to pipe the radio into my stereo system. I can also use the rig to monitor the FM broadcast band without removing the cassette adapter every time.. By far this is the best radio I have ever owned and its serving me well. I am working on an FT 757GX thats stuck in Transmit (anyone have this trouble???? Yaesu doesnt describe the PTT circuit at all in the service manual!!), when this rig is ready to go in the car, I will send the FT100 in for some updates.. Anyway, the two antenna ports support HF thru 6m on one and 2m/440 on the other. To use the ATAS for all bands you would need a duplexer to tie in the two ports to the one ATAS (Comet and Diamond make these for the 706 Icom which are suitable for the FT100 providing you use the "706 Mark II G" as the comparison radio). I simply use the ATAS for HF thru 6m and the dual band Cushcraft magmount on the other port. This is simple enough and eliminates having a bulky duplexer hanging off the back of the rig.. I pack mine up in a padded "Zip drive" carry bag when I leave the car, they retail for 29 bucks and it does a superb job of protecting the rig when its not in use.. It even has room for a few accessories which store in a separate partition (The FT100 is THAT small!!) within the zip drive carry bag. As far as mounting the ATAS, Comet and Diamond make a few SO239 mounts which can be used. I have the CQ5M trunk mount which works great on my Firebird. Its supplied with coax and is ready to go upon assembly and mounting. If you have a Truck, ask a few guys here for some tips on mounting as this has been thrown around a few times here... Good Luck! Hi. My installer lost those stupid little screws used in the panel seperation kit and it is now useless without them. Can anyone find their instruction manual for the kit and tell me the size and type used to affix the cable to the radio? Near as I can guess they are 2.6mm fine pitch pan-head but I am not sure, and I need the length also.

I called Yeasu tech and keft a message but no response.

A quick response possibly direct to pres@... would be appreciated because I am on a digest (delay)

Pres:
I installed the head separation bracket with the Radio Shack/Archer Hi Temp/Hi-Strength SUPERLOCK FASTENERS cat no. 64-2360. I used these in my Audi A6 and it's as solid as any screwed-in unit I've ever mounted, not like regular or even heavy duty velcro. If you can't get the hardware kit from Yaesu, it's worth a try.

Pres....the screws are listed in the separation kit installation
brochure as 2.6 mm by 7 mm (2 pcs) and 2.6 mm by 12 mm (2 pcs) machine
screws, (observation...phillips and with tapered heads). I think the
tapers are necessary in order to allow room for the control head to snap
into place...Here in Houston, there are several places that sell metric
screws and this size is not unusual.....Dale KC2PZ

Hi Pres,

Its made for I/O mega and has an embroidered logo on it indicating a zip drive case, its quite easy to spot in Office Max, if you cant find it in LI, let me know... There are a few Office Max stores here in Staten Island which have them for around $29 bucks.. Believe me they are worth it, the radio fits in there nice and its padded real well. I take my radio everyday to work and it still looks great and works fantastic so the case is doing its job..
Happy Holidays to the group.. Richy KB2CPW

If you truelly want to only run 10 meters, 2 and 70cm then all you need is one 10 meter hamstick and one dual band 2 meter 70cm. antenna. Larson makes good dual band antennas. You wont need an duplexors etc for this setup.

You will be loosing out on 6 Meters and sadly you wont be able to hear allot on the hf bands below 10 meters...

BUT... You could always upgrade to the ATAS antenna later. You won't find a slicker, better, smaller more versatile antenna fro the Ft100 than the ATAS antenna. It (IS) worth what Yeasu is asking for it...

Subject: [FT100] FT100 Antennae?

From: "Tully Steward" <tully.s@...>

Hi guys--
What pieces are needed to use the FT100 mobile? I'm pretty confused by all
the mounting, duplexer, coax options. I -think- I want to run 10m, 2m, and
0.70m mainly. I've noticed that the FT100 has two antenna connectors. I
know that there's been high praise for the ATAS-100 but I'd rather go with
conventional fixed antennae for now. Do I get a dual-band and a 10m antenna
and connect them directly to the FT100 or should I try to use 1 tri-band
with a duplexer?
Any competent advise, especially part numbers, would be welcome.
Tully Steward, KC0GNY

Malcom, Et al,,, Mount the FT100 in a good operating position. Then run a large gauge lead from the mounting screw on the FT100 directly to the floor or fire wall of the vehicle. Run the battery leads as direct to the battery as possible. Don't mess with cigarette lighter connections, 'trouble'!... Mount the ATAS in a clear location on your trunk, 'boot', or roof. CLEAN the metal around where the mount is located. Next try to use a new piece of coax, maybe RG8x. "It Works on all ham bands"! AMEN already, very 73s de 'A happy Camper', John W8JW, Rochester, NY

Alan

K9CTF >>

The ATAS will work all day long on those bands, Yaesu doesnt guarantee auto tuning on those bands but the ATAS will in fact tune perfectly there. I even find that it auto tunes perfectly there also. Sometimes you may have to manual tune the ATAS via the ptt and up/down keys to get a lower swr, I have to do this on 20m sometimes, no biggy though as it takes 1/2 second to tweak a perfect match. Good Luck Richy

While I don't have an ATAS100 (yet) and I am interested and concerned about the anomalous behavior I'm reading about them, my question and curiosity is about not 'when fixed', do they work, but 'when fixed' do they keep working.

Do they fail after a while (exhibiting the same pre-fix behavior) or do they consistently perform?

Thanks and 73,

Alan...The FT100 manual says that the ATAS100 is not optimized for the 17 and 12 meter bands. However, I have not had any problems transmitting on these bands. If you get a "SWR" X symbol, just use the manual button and the up or down buttons to move it slightly to make a better match.....Dale KC2PZ

I may be old-fashioned, but the idea of dumping 100 watts into a high SWR does not seem quite right to me. Granted the SWR protect circuit will lower the power, but that takes time (ok, msec's) but during that time you have higher than normal voltages present. What will that do to all those little relay contacts in the AT-11 ? You may fault me for being cautious, but I like to treat my radios like family !! No worries Richard. If you want to do it with lower power. Just do a quick mode change to AM and you'll hit it with just 25 Watts of carrier. They are pretty heavy relays in the AT-11. The power limiting bits are actually the capacitors. But anyway, just buy it mate. I assembled mine over 2 years ago on a Saturday afternoon and I'm so glad I did. The tuning range is extraordinary. Cheers, Alek. At 07:47 PM 12-12-99 -0500, you wrote: >From: "Richard W. Solomon" > >I may be old-fashioned, but the idea of dumping 100 watts into a high >SWR does not seem quite right to me. Do they fail after a while (exhibiting the same pre-fix behavior) or do they
consistently perform?

Thanks and 73,
dale kg5u >>

IMHO,

I believe many are being sent back in perfect working order, many think the
antenna "Failed" when it glitches and must tune for a period of about a
minute and a half before reversing and finding a match. I am sure this can be
remedied in the firmware but Yaesu has yet to act. Although there are some
bonified failures as with all products offered out there, many are simply
"failure of the end user" not reading the manual.. I drive 56 miles a day
from Staten Island to the Bronx with my Trusty Firebird, FT100 and ATAS. The
roads are very bad and the ATAS takes some beating for sure. I have had this
setup mobile from the end of July until now and the only problem has been the
rf troubles which I rectified using a toroid core and better grounding. Once
again, the ATAS could fail, I am not saying it doesn't as I have rx emails
from owners with damaged antennas that weren't too happy about my comment on
the manual reading, I am sure a handful of those users sent them back without
reading the manual and understanding the nature of the beast.
Good Luck.. Richy

IC706MKII at the next hamfest. >>

Alan,

Dump the FC-20 now while its still worth $200-225 to the "anal" ham who
must have matching Yaesu equipment. BTW I finally picked up the tuner of my
dreams, the Ten Tec 253 auto tuner, a rare bird to find for sure! I am
finishing up a Dentron MLA2500 conversion from 8875's to a pair of 3cx800a7's
and this will work FB as the end item for my Shack setup.
Whats cool about the TT tuner is its 12 volts, as soon as I can figure out
how to get the Dentron and my portable generator crammed in the Firebirds
trunk, I will hook it up to my FT100 and dump 1.2kw into the ATAS :-P
Happy Holidays... Richy

The tuner will tune a match up to 150 watts, pretty rugged I might add! The
Tune button will only activate with an FC20 or ATAS hooked up to the radio
and the sub menu programmed to either above mentioned item. The choices are:

1. Tuner
2. ATAS with a suitable duplexer (used for all bands offered)
3. ATAS (HF up to 6m only)
4. OFF

BTW the signal is only sent on the HF line so the tune button can be
activated but the ATAS will not tune using the 2m/440 antenna jack... Richy

Use the AM mode for a tune mode. Be sure you have set the power to a lower level in the AM mode (I believe the FT-100 remembers the power setting for AM separately).

AM mode is low power. 25 Watts without modulation. You don't need to turn
it down.

Hello All,
I got the FT-100 to receive 850-860 public services, but, it is so weak that you just about have to be under a tower to hear it. Is there some mod or enhancement to make 850-860 receive better? Older ICOMS had a 'secret' antenna connection. I have been looking around inside, but, this type of secret is not found.
Any leads would be much appreciated. I like my FT-100 so far!

2179. FT100 problem

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-14 11:23:05 UTC
From: Bob Sayers
Topic: 2179 Message: 2179

Hi, All;
Has anyone else experienced a fault in the switching time of
(presumably) the realys controlling the front-end filters?

My '100 will now often take over a minute before a relay audibly
clicks in and provides correct sensitivity, if a fairly large
frequency change is made.

Last night, tuning the 7MHz band, I had excellent sensitivity up to
exactly 7.5MHz (which is presumably the programmed limit of one
band-pass filter?) and nothing at all above it. After 2-3 minutes,
the relay clicked in, and normal service was resumed.

Any simple solution to this, or is it a return-to-dealer job?

Bob, G8IYK

Date: 1999-12-14 15:51:00 UTC
From: Robert Gauss
Topic: 505 Message: 2181

I use mine to tune a G5RV on 75/40/20 and to tune interlaced quad loops cut for 15 and 10 meters on 17/15/12/10 meters and to tune a quad loop for 6 meters on 6. None of the loops have any 100 to 50 ohm matching usually done for loop antennas. I do not think the tuner has a wide match range. I think it is best used as a "line flattener" band-width extender for already nearly resonant antennas. I wouldn't recommend it for tuning random length wires.

Works reasonably well. Seems slow when you push the TUN button. It also automatically tunes if the SWR is high. The TUN button forces a tune and stores the tune settings for that frequency. If you just put it in AM and transmit a carrier for a bit it will autotune as well but not remember the settings.

When tuning up and down the band you often see the tune icon come on as the tuner resets to new values based upon memory settings. Cute icon looks like a variable capacitor spinning around and around.

I hear great things about the AT-100 autotuner that sometimes make me question my decision, especially regarding the speed and match range of the AT-100. Although I did hear a 2nd hand report this morning on 2 FM of a problem with it tuning on 10 meters. No details.

The FC-20 looks well made inside to me. Besides the usual relays switching fixed capacitors and inductors, there are two stepper motor driven air variable caps for fine tuning.

Bob

Kevin...it may have RF getting back into the tuning logic....ground the
body of the radio to a good ground (frame of car) and use a ferrite
donut with three turns of coax under the ATAS100. This may allow your
antenna to find a match it likes....Dale KC2PZ

Firstly, check the coax and if all is ok suspect bad grounding of the ATAS
or RF feedback clouding your readings. If you insert a Bird meter in line and
the Bird shows a good match suspect the RF feedback. I have posted this
problem and rx many good remedies. The best by far was the insertion of a
large ferrite donut with 5 turns of the coax passed thru it. This seemed to
solve all of my problems as did the adding of a ground from the radio to the
floor of the car. I also tossed a very small ferrite donut on the mic line
since there was one complaint of RF sneaking in on the mic line. I made 3
passes of the mic cord thru the center for good measure. If you suspect the
radio is the problem, Yaesu supposedly rx a fix from Japan a few weeks back
to help combat this problem... Good Luck.. Richy

Can anyone tell me if Yaesu has issued an addendum to their manual describing how to operate the radio in the AM mode? The manual I have is silent on the matter. My radio SN is 9E031371 and the manual number is 9902n-BY. There are no AM operating instructions in it.

By the way, I measured the output of the unmodulated AM carrier into a dummy load with the HF TX PO (menu number 21) set at 100 and it is about 90 watts. Someone on the reflector told me that it was 25 watts at a setting of 100. Not so.

Sorry, I must have missed the post that mentioned 100% = 25 watts or I would have jumped in. Recommended max output (per a conversation with a Yaesu Tech) is 25% = appx 25 watts. Beyond the 25% setting your signal will be very wide and highly distored. This agrees with my actual use of the radio in AM adn in conjuction with metered output.

Thanks Mike. 90% gets me 25 watts out on a watt meter into a dummy load. The percentages are not linear with the output. The reports I have gotten to date in the AM mode have not been very good. Distortion is the major problem. But I will work on the power thing some more and see if it improves. I don't expect real quality audio in the AM mode on the FT-100 but hope that I can get it to be respectable at the least. Thanks again.

Sorry guys, that was my fault, saying that the AM power was 25 Watts flat out. It was BS.

I didn't have my radio at that time. I just got it back yesterday from having the 70cm fault fixed and can verify that it is 100W and not 25W.

In fact one of the things they did do to the radio was to get it to put out the full 100W on each band. Previously it was around 80W on average, new out of the box.

You have to wonder why they don't come out of the factory properly tuned up when you buy the radio.

2m and 70cm powers were brought up to specs as well.

If you bring up the "hidden" menu function (holding down the A-B-C buttons while
turning the radio on) dial up F51 (the F menus are between 61 & 1). This is the
AM carrier setting window for all bands. I have turned mine down to 088. I don't
know why Yaesu has them set so high, when they say it should be 25 watts.

Kev >>

Great Kev!!,

Glad to hear that you didn't pull your hair out trying to rectify it like
me :-) anyway thank the group since they passed that trick along to me. Some
people get it right from the shipping box to the car but some installations
cause this trouble. BTW what is the lot number of your radio? Mine is a 9E
that means 9=1999 E=May, if you bought the radio recently the Lot number 9K
should have the extra rf shielding (I heard). The problem is Stray RF getting
back to the rig, since the radio is so small and lacks traditional shielding
it took some time for Yaesu to see the problem in the field and it takes a
few months to implement a fix. You can send the rig in for updates, I am
going to do this as soon as I finish up repairs on a FT757GX for my car. I
figure a two week turnaround. Its really not a big deal since the Ferrites
usually do the trick.. Good Luck and Happy Holidays.. Richy

Once !

At least I think it might be related.

While tuning up and down the 20 meter band, using a 10 meter antenna for RX purpose only, I accidentally hit the PTT on the microphone. Immediately after releasing the PTT the RX was almost dead. All of the heard signals were either gone or down to the noise level. Actually the noise level was way down also. Changing bands or tuning did nothing to improve the signals on any band. After powering down the radio for a few minutes, the signals were back to previous levels after turning it back on.

I have not noticed any other delays while tuning only. Beside this only happened once.

Also has anyone noticed, and this only happened 3 times in 1 day in the last month, after releasing the PTT on the microphone the radio is still indicating TX and no RX audio is heard. Once it lasted 15 seconds. No mechanical problems noted with the PTT button, connections etc. It was very frustrating on a DX QSO where if your not back in a few seconds, the pile up begins with the other stations jumping in.

Subject: [FT100] FT100 problem

From: Bob Sayers <bob.sayers@...>

Hi, All;
Has anyone else experienced a fault in the switching time of
(presumably) the realys controlling the front-end filters?

My '100 will now often take over a minute before a relay audibly
clicks in and provides correct sensitivity, if a fairly large
frequency change is made.

Last night, tuning the 7MHz band, I had excellent sensitivity up to exactly 7.5MHz (which is presumably the programmed limit of one band-pass filter?) and nothing at all above it. After 2-3 minutes, the relay clicked in, and normal service was resumed.

Any simple solution to this, or is it a return-to-dealer job?

Bob, G8IYK

Jim:
Note that it's possible to have TX sticking problems due to RF getting
back into the radio (power cord, mic cord, etc). This can also cause other
wierd confusion of the processor.

Hello all FT100 owners,

I finally got around to picking up the AM filter and CTCSS board. I know there has been some confusion as to where the correct location is for the AM filter, and hearing that is isn't the easiest task, I was hoping someone could remind me as to which slot is actually the correct one. I don't want to discover a typo in my manual AFTER the fact! I am only going to install the AM filter, no plans for a CW filter in the future, as I am not a CW buff.

While on this note, is there anything I should watch for when installing the CTCSS board ?

Also, I purchased the data cable. Is there any good program(s) out there to load up the 100 memories via the PC BEFORE I put this rig in the car ?

Thanks in advance for your suggestions and comments.

Topic: 2202 Message: 2202

Hello all,
I recently purchased the ft100 with the atas-100. It's a great radio, and I appreciate the
help I have allready gotten from this list.

I am a little worried about people stealing my atas-100 antennia while my car is parked somewhere. I have a diamond lip mount, so I know the mounts not going anywhere, but all one has to do is unscrew the antennia. I would like to hear from those who also live in cities - has anybody had there antennia stollen, maybe I'm worrying about nothing, maybe people have no interest in antennias. I doubt most people would know what to do with it. Have most people on this list driven around and parked there cars in public parking without anyproblems?

Thanks,
Reed

I use the COMET CQ5M mount which allows for a quick disconnect and in the trunk it goes in less than 15 seconds. It would be nice if we could drill a couple of holes and put in some allen head set screws to prevent it from "easily" being unscrewed. Who will be the first to try?

I would suspect the bigger vulerability is someone just coming along and trying to break it off - it would probably take too long for someone to consider unscrewing it from it's base. I just remove mine when not actually in use - a bit time consuming but that's why I have a small separate antenna for VHF/UHF.

I share your concern. I travel to the centre of Birmingham, UK every day, and would certainly never leave it on the car whilst unattended, even in the company car park with CCTV monitoring. On some roads in Birmingham, I worry if I have to slow below 20mph (3 colleagues mobile phones snatched from passenger seats in a two month period) although I suppose the option of providing 100 watts of RF adds a certain security factor...

On extended highway drives at 70mph+, I also have some concern about the antenna coming loose from a mount, and the damage that this might do to a following vehicle (to say nothing of the ATAS). I secure mine with a length of terylene cord to the top of the thick part of the antenna body, so that if it should come loose it will hang, but still clear of the ground.

Incidentally, for preserving the antenna while stored in the car, a common size of PVC rainwater drainage downpipe available in the UK fits the ATAS perfectly, is sufficiently strong, and can even be fitted with end caps if desired.

One good thing about the ATAS-100.....it only works with the FT-100 and
FT-847...less opportunity to fence the thing for general
use.....Although I heard that someone has a method for using it on a
IC-706 mkII G.....Dale KC2PZ

2207. Future owner of a FT-100

Greetings,
I have been ?reading the mail? and thought I would jump in. I have been "looking" at the FT-100 since April. I have read the QST reviews and read a lot of comments on the rig. Sounds like the mobile installation of this rig needs a good RF ground as a necessity. I like about 95% of what I hear and I think my wallet has quit jumping when I look at the adds now.

I have never been mobile on HF and wonder what accessories would be a good set up with the FT-100. Obviously the ATAS-100 antenna, the YSK-100, SEPARATION KIT, MMB-67, QWIK RELEASE MT, and even a Zip Drive case to store it in (see I do read the archives). I am not into mobile CW, but what about other filter choices ?

What are the .. CT-58, BAND DATA CABLE, CT-62, CAT INTERFACE CABLE, ADMS-2D, PC PRGM, FTS-27, CTCSS DEC.UNIT (will it incode/decode ?) used for ?

(kind of new to this Internet format, forgive any social errors of this newbee)

TNX,
Chris
WD9HIK

PS Thanks to all you guys that bought the first ones out and are curring all the bad habits of this radio (along with Yeasu).

> were saying?

Try tuning either on channel, 10kHz higher or 10kHz lower. All U.S. VHF TV stations are assigned one of those offsets from the "standard" frequencies that most of us think of for the video carrier and the FM audio. From observation, the UHF ones may also include + and - 20kHz, but that is only an observation.

Depending upon the width of the IF filter (i.e. relatively narrow), being
on the CORRECT frequency (+10, -10 or 0) will make a difference.

This knowledge is also helpful if you are looking for meteor trail "pings"
on TV channel 2 (from the VSB video carrier). Tune +10, -10 or zero (plus
a small offset for the USB or LSB mode, so as not to be zero beat).

From http://ourworld.compuserve.com/homepages/f6dex/ it appears that
[quoted from the TRX-Manager Help file] "? With FT-847 or FT-100 it is
not possible to read/write the internal memory channels of the
transceiver : memory channels implemented by TRX-Manager are virtual
and not related to the channels of the transceiver."

You can write memories to the PC HD and use those from the PC but that
kind of defeats the mobile aspect of the FT-100.

Hope you get some positive feedback to your question.

My manual date (back cover page, lower left corner) is 9902n-BY. I can attest to the fact that it's representation of the filter positions is correct.

The narrow (300Hz - XF-117CN) or AM (6kHz - XF-117A) go into the frontmost filter slot. The wide (500Hz - XF-117C) filter goes in the rearmost slot (closest to the 2.4kHz filter--shiny little 1" long enclosure).

Earlier editions of the manual have had the filter positions reversed. These editions usually were accompanied by an addenda sheet to correct that misprint.

AM/Narrow CW to the front; Wide CW to the back.

IF YOU ARE NOT AN EXPERIENCED SOLDERER? Do you do surface mount technology component soldering? Do you do flight-certified soldering? If no to either, I highly recommend you package everything up and ship it to Yaesu and let them do it. Besides, if there are any mods/updates, they will do them for you, too.

If you do attempt it, you will need a very narrow solder pencil. Clean the filter pins prior to installing. Surface mount components are positioned around and very close to the filter pin locations. One little slip is all it takes.

Good luck,

dale, kg5u

2215. My New FT-100...a few questions

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-19 01:14:29 UTC
From: WW4WJD@xxxxx.xxxxxxxxxxxxxxx)
Topic: 2215 Message: 2215

Fellow FT-100 Owners/Enthusiasts,

I purchased my first FT-100 yesterday and feel good about the timing of my purchase.

Yaesu is offering a $100 instant rebate coupon on the FT-100 and I feel that the transceiver has been out long enough that the major bugs have been worked out.

I purchased the FT-100 at AES here in Orlando, and requested the lastest serial number in stock.

This FT-100 just came into stock a few days ago and is serial number: 9J101XXX

A few observations/questions...

1. Temporarily, I placed the FT-100 in my home for use as a base rig, using a Cushcraft dual band yagi and a ASTRON RS-20M power supply. Specifically operating just on 2M/440, I observed the following.

On 2 meters, 50 watts, on transmit the RS-20M is indicating 15.5 amps...that seems a bit high and out of the ordinary.

2. The signal strength meter seems to pickup local repeaters that normally peg my other base rig at S9+60...only at a S5-6. The low signal strength reading has me a bit concerned.

3. The FT-100 will be mounted in my 97' Ford Expedition XLT. I did purchase the seperation kit for this installation, which will be professionally done by our local "Sound Advice" next Tuesday.

I have the ATAS-100 and ATAS-BK from the previous purchase of my FT-847.

I wish to mount the ATAS-100 on the drivers side cowl, where I currently have my COMET-B-20.

The B-20 would stay on that mount primarily, and I would put on the ATAS-100 when I wanted to talk 10 meters, since I am a tech-plus.

My other option is to keep the B-20 on the Cowl and run a mag mount in the rear center of the vehicle. I have tried this using the ATAS-100, with the base kit installed, in conjunction with my using my FT-847. I find that the ATAS with BK gives me a good ground.

Question: has anyone found a right angle aluminum mount strong enough to support the ATAS-100?

4. I have a Heil HM-10 that I would like to use HF mobile with the FT-100. Has anyone purchased the Heil adapter for the FT-100 and had good results with the HM-10?

Thanks In Advance

Warm Regards,

Topic: 2216 Message: 2216

Hi,
Bought a Atas 12 days ago and it worked well in the drive way and around town, but today took it on a extended trip. It tuned well on 40 M, but had trouble with 10 & 20 M and then just stoped. Now when I push the tune button the yellow light lights up and the anntena does not move.
Is it broken...or need sent back
Can I unstick it somehow
Someone on 20 M told me that he thought their was a way to Manually tune it
I have a very good ground for the mount but cannot think of anything else to do
Thanks
Mike AA8JI

Has anybody successfully activated the general coverage transmit mod for the FT-100?

If you have done it, what was the procedure you used?

Is there something missing in the published mod procedure?

73 de Alek,
VK6APK

Hi, manuel tuning is normally no problem if the antenna is working, look in the handbook you can find it. But I had the same problem and had to send back the antenna to yaesu. They told me that the on chip has been broken. 73 Gerd DL1GVM

Joe:
You may want to put it on a calibrated signal generator to see how
sensitive the radio is, but I believe you'll find it's OK. If I remember
correctly, the FT-100 reads real signal strength on FM rather than
limiting, which most other units do. That's why most VHF/UHF FM radios
tend to read obsurdly high signal levels, like S9+60.

If you have not gotten any responses, the manual does tell how to do this. If it is all the way up, then hold the PTT on the mike in any band lower than 2 meters (6 meters on down to HF where it will transmit) and then push either the UP band or DOWN band buttons to the left of the VFO knob while holding down the PTT. There are times that the antenna will get "stuck" like this and then jogging it manually whill make it start to tune again. If the band you want is lower and the antenna needs to be longer, then just hit the up button for a bit and then let it tune itself. I use the up and down buttons to fine tune the antenna on the warc bands. I hope that this helps and all people that own this antenna and radio should know about this. I know that there have been several that have been sent back to the factory for the same condition when it can be remedied and is "normal". The other thing to do if the antenna gets stuck and the tune indicator will not turn off, just wait a few minutes as the timer for tune will shut off after a few minutes and then you can manually move the antenna using the up and down buttons while holding the PTT and then start the auto tune again.

From: SS409SS@xxx.xxx
Topic: 2221 Message: 2221

I was tuning around with the ATAS the other day and using the manual method also (PTT and Up/Down buttons) I then thought, "Hey, maybe it will tune using the PTT and the band buttons on the lower front of the mic"... Well it does send the command to the radio as the icon does engage on the display but no ATAS action. Well, I tried!! Richy

Key the mic first, then the up or down button on the FRONT of the mic to see the icon, thats the buttons that change bands....

Read Write memories with computer.

With TRX ManagerYou can read edit and write memories to and from
the ft847 and ft100 you can read the from the radio and save them
to a file. but you can not swap fies with someone else. yeasu did a
stupidoin that each transiever has its own checksumin the cpu .
therfore you cant pull them from your 847 and dump them into your
ft 100 .Seems yeasu engineers went to the American School of Traffic
Light Programming ...HI..HI..!.

For those with a new atas 100 antenna.

If your atas 100 seems to stop then you are the one who needs to stop.
Stop pressing the tune button. press the tune button only once to turn
it on.let it run the atas 100 has a clutch and the radio needs to time
out before it goes the other direction. it will take a few minutes.
i also thought mine was broke. 73's gene

Subject: filter explained hopefully better from my expirience
There is the small 2.4khz filter then two larger slots for aditional

optional filters . the one next to the 2.4 khz is for the 500 hz filter slot
,install the 300 hz or 500 hz filter thereif you want the am filter.
this means you have to turn on the 500 hz filter in the setup menu and selct
the 500 hz fliter to use this 300 hz filter. the last slot fartherest away
from the 2.4khz filter which going this direction is toword the front of the
radio install the am filter there and in the setup filter turn on the 6 khz
filter.The 300 hz filter will work in the 500 hz filter position , at least in
recieve i have not tried xmit i dont have ant setup.

p.s. The 2.4 khz is toward the rear of the radio in relation to the
other slots.and the am goes closest to the front and the 300 hz in
the middle .
73's and enjoy Gene WD5FDL

From: Rene Campbell
Topic: 2229 Message: 2229

I was curious what you thought about the ATAS-BK kit. I have not been able to find a description of it on the Yaesu web site. When I sent a message into their tech support department they explained it as something that was only intended for use on 6m, 2m, 440 MHz. And their usual statement, try it on the other bands.

If you have any insights on this, I'd like to know.

Rene

Alek,

I don't know about Australia, but here in the U.S., it's illegal to transmit out of band.

It is also technically illegal to use non-type-accepted equipment outside the bands for which they were designed (meaning: amateur radio equipment modified to operate outside the amateur radio bands).

I understand from an ARRL bulletin or the ARRL Letter that our Federal Communications Commission is cracking down on individuals/organizations using non-type-accepted equipment on frequencies for which they weren't originally designed to operate--don't ask me what they will do regarding MARS; ask them.

So, for most of us, who have no intention or need to transmit outside the amateur radio bands, there's no reason to go in and modify a good radio.

Oh yes. Been a ham for many, many years. Buildt, modified, and (oops!) broke all kinds of equipment, and hopefully learned something from it.

I am a ham.

73,
dale, kg5u

I made a trip to the local computer/department store today and just for the fun of it, looked at the "ZIP DRIVE" bags that you guys were referring to on the list that the FT100 fits in.

I also happened to stop by the area where they sell the small CD players, and the CD player cases. There was the IDENTICAL case, with a slightly different name (same manufacturer) and for $2 LESS.

I left a hint for Santa...

That's all quite true Dale. A similar situation exists here in Oz as far as out of band transmission is concerned.

The one exception is the 27 MHz CB band for which there is no licence requirement and it is legal to run 12 Watts PEP or 5 Watts Carrier. The FT 100 would achieve this very nicely. When on the road, it is nice to be able to have the option of talking to fellow travellers who are not hams. (There is a much better relationship between hams and cbers here than in the US)

Also, it is not illegal in any way, shape or form to own a radio which transmits out of band in this country.

Thirdly, when doing antenna work, particularly mobile HF whips, it is just so handy to be able to use the radio as a high power signal generator with built in SWR meter to find resonant frequencies etc whilst adding or removing turns from the whip.

Those are the reasons we want to modify the tx range of the radio.

My friend did the mod yesterday and followed the instructions word for word and it did not work.

I have not tried the mod as yet because I do not need it. I would however, like to have the correct information on hand, should the situation change.

Cheers mate,
Alek VK6APK.

Hello all,
Thanks to all of you who confirmed were the filters are to be placed. I have installed the 6 kHz and the 500 Hz filter as well as the decoder today and it all works fine. Although it was not to difficult I will say it was the most challenging install I have ever done. I don't think this stuff will get better in the future. Maybe we will all be buying radios with factory installed filters in the next 5 years or it will all be dsp stuff.
Anyway thanks for the help.

What are the component values in the microphone wiring diagram in the "files" portion of this community.
The schematic shows values for resistors as:
2K2 = ?
1K8 = ?
1k = 1000 ohms?
27K = 27,000 ohms?
The schematic shows values for capacitors as:
47u = 47 mfd ?
2n2 = ?
4u7 = ?
10u = 10 mfd ?
I plan to adapt a Premier/Pryme SPM-400 or SPM-401 earphone/eletret boom microphone for use on the FT100 and I need to construct the circuit in the file.

I love my week old FT-100 with the ATAS-100 antenna on my Honda Accord. Has anyone figured out how to get rid of the terrible ignition noise from the Hondas, the Noise Blanker cannot remove it all and I have an S7 pulse level that varies proportionately with engine speed. I replaced the plug wires with new ones, but not luck reducing the pulse noise.

2K2 = 2.2K = 2,200 Ohms
1K8 = 1.8K = 1,800 Ohms
1K = 1000 Ohms
2n2 = 2.2nF = 0.0022uF
47u = 47uF
4u7 = 4.7uF
etc etc

This labelling convention has been in use for quite a few years now.

From the above examples, you should be able to see the pattern and relate
that to any other strange values you may find.

Don't ask why they had to change from the good old way.

73, hope it helps,
Alek, VK6APK.

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-21 07:36:00 UTC
From: Rainer Arndt (ERA)
Topic: 2229 Message: 2242

The BK is just a mounting kit consisting of a base plate, connector and possibility to fasten som radials. To my opinion it's not worth the money.

Subject: [FT100] ATAS-BK (Base Station Kit) for ATAS-100

From: "Rene Campbell" <rcampbell@...>

I was curious what you thought about the ATAS-BK kit. I have not been able to find a description of it on the Yaesu web site. When I sent a message into their tech support department they explained it as something that was only intended for use on 6m, 2m, 440 MHz. And their usual statement, try it on the other bands.

If you have any insights on this, I'd like to know.

Rene

>you can not edit the ft100 , so lets all yell at yeasu
>Loud enough and maybe they will upgrade the cpu software(which means

Also, I vote for the following:

The ability to group various disparate functions from various Func key positions into one Func key position.
(e.g., CW speed, 500Hz filter, NB, Keyer Play -- I'm sure others have other preferences they would like to see on one Func position).

The ability to select or reverse the Power output/SWR metering so that SWR is the larger display and Power out is the little thin line that one cannot see until one runs off the road. :-) I prefer to watch SWR as a measure of antenna/feedline condition.

73 and Happy Holidays,

2244. ATAS-100 Location

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-21 13:36:57 UTC
From: Dale L. Martin
Topic: 2244 Message: 2244

I'm getting close to ordering an ATAS-100.

I'd like to pick the brains of those with the ATAS-100's about where on the vehicle they have mounted the antenna.

My vehicle is a 98 Saturn SC2 (coupe). My current HF antenna is my trusty old Hustler breakover-mast and resonator mounted on an homebrew trailer hitch mount (http://www.hal-pc.org/~kg5u/mount.html). It works great, but, of course, the band-changing ability is time and labor intensive (and seriously affects average travelling speed!!!!).

My initial thought is to simply mount the antenna on the center front lip of the trunk lid. Is that a viable location? I'm sure the antenna presence will limit how open the lid will raise, but that's probably okay. From a physical strain standpoint, has anyone noticed much in the way of the trunk lid lip being stressed or warped from the antenna?

What other locations might be suitable? Are there mounts which will attach to the aft lower lip (vertical) of the trunk lid?

At some point in time, based on it's performance in a particular location on the car, I'd likely punch a hole in the car and hard mount the antenna base.

Knowing that mounting it high is preferred, what about mounting it down on my hitch mount? I haven't done any real measurements and I've never seen an ATAS-100 in real life to get a handle on it's real size. From my reading of others' comments here, I'm guessing that that's way too low for effective and efficient use of the antenna. What's my garage clearance of the antenna? I have a 'normal' double two-door garage with about 8' clearance. How do others cope with low clearances and the antenna deck-mounted?

Thanks for any info any and all can provide.

73,
Dale Martin, KG5U

From: William Mastop
Topic: 2244 Message: 2245

I have it mounted on the leading edge of the trunk on a 1985 ford tbird. The mount is, as best I can recall, a diamond k400 mount. So far, no problems at all, and no warpage of the trunk lid itself. It has received extensive testing, including many hours of driving at 80 mile an hour or more speeds.
Two things to watch for:
a. Close the trunk lid gently. If the lid is slammed down, there's considerable strain then placed on the trunk lip as a result of the size of the antenna.
b. Open the trunk lid gently. If allowed to just swing open, there is considerable risk of the antenna whip striking the roof of the car. You pretty much have to stop using any automatic trunk lid opening devices.
Have fun.

Congrads on your choice! I would suggest that you not mount the atas on the
trunk lid. My mount is wearing thru the paint of my Firebird rather quickly
and I also own a 98 Saturn SL2. Knowing this I would not mount the ATAS to
this vehicle, instead, I would consider this since you have the trailer hitch
already.

Get some square aluminum stock or round aluminum pipe have the one end
welded up with a bolt protruding from the hitch end and place this thru the
Hitch ball mounting hole. At the top you can make a plate where the ATAS can
be mounted using the 239 style mount. It simply has to clear the trunk lid by
about 6 inches to give you good gain and reliability. At the center of the
mount, make two rings where bungy straps can be hooked to pass into the trunk
area to provide some center support for those "Hi Speed" QSO's. The ATAS is a
heavy, bulky antenna and unlike the typical dual band Diamond will damage
your lid either by wearing away the paint or stressing the lid.. My Firebird
is a $hitbox so I really dont care what it does, but the mount is wearing
away the paint on it.. My Saturn has a much thinner metal in this area and I
would suspect that the mount will damage the paint. The added benefit of the
above hitch mount is that you can slip the tongue out of the hitch and toss
it in the trunk when you are finished.... Regards.. Richy

From: Timothy H. Heaton
Topic: 2248 Message: 2248

Hi gang. I finally did it--I just ordered my FT-100! I want to thank all of you who I've pestered for information over the past three months. Special thanks goes to Dale (KG5U) who has answered several of my long queries. Thanks to this group, this is one of the most informed decisions I have ever made!

Since the going price on the FT-100 was $1099.95, I shopped around for prices on the XF-117C 500 Hz filter (the one accessory I really wanted). I found the best prices at HRO (most had a discount if you bought it with the rig--uninstalled--but several salesmen told me it was "plug-n-play" and didn't require soldering!--until I made them check it out--ouch!). Even among HRO stores the price varied ($149, $139, $130, $129, $125). I went with the lowest price (from Eric at the Atlanta store).

I'm sure you'll hear more from me as I explore all of the radio's features. It took me a month to master the VX-5R I bought last summer, so the FT-100 may take a year or more! :-) 73's all & Merry Christmas.

2249. Interface of ATAS controls to conventional srewdriver

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-21 17:11:47 UTC
From: David Feldman
Topic: 2249 Message: 2249

Anyone considered building an interface that would extract the FT100 integrated controls for the ATAS and adapt them to the up/down controls of a regular screwdriver antenna? Is there a microprocessor in the ATAS base, or is it just recovering a simply encoded signal to command up and down? It seems as the ATAS has no limit switch that there is no feedback from the antenna unit to the radio indicating position.

Dave

From: Pres Waterman
Topic: 2251 Message: 2251

I love my week old FT-100 with the ATAS-100 antenna on my Honda Accord. Has anyone figured out how to get rid of the terrible ignition noise from the Hondas, the Noise Blanker cannot remove it all and I have an S7 pulse level that varies proportionately with engine speed. I replaced the plug wires with new ones, but not luck reducing the pulse noise.
Glen - WB4KTF

[Pres Waterman]

Try a new CAP as in cap-n-rotor. I found that new Mustangs needed a service part cap immediately because they are slightly different from the manufacture part. Change the cap...cut the ignition noise.

Topic: 2254 Message: 2254

Fellow FT-100 Owners & Enthusiasts,

Today, I had a "Sound Advice" (A High End Audio Shop) Manager install my Yaesu FT-100 into my 97' Ford Expedition. Cosmetically the installation looks excellent.

A few questions regarding ATAS-100 antenna grounding...

1. I am running a ATAS-100 in conjunction with a thin metal "L" Bracket" and SO-239 mount on the drivers side cowl of my Ford Expedition. The "L" Bracket is secured with screws underneath my hood on the drivers side, near the base of the windshield.

My installer measured the impedance of the ground at several places in the engine compartment of my Expedition.

On my Expedition, the battery is on the passenger side of the vehicle, closest to the passenger compartment. The antenna mount is on the drivers side, again, closest to the passenger compartment.

At the negative battery terminal, he measured 0.7 ohms of resistance, with a FLUKE Multimeter.

Next, he checked the ground at the base of the ATAS-100 mount and discovered 12.6 ohms of resistance, just 5 feet away from the battery!

He then ran a 4 gauge wire from the battery to the frame and (2) 10 gauge wires from the battery to the antenna mount.

Checking the antenna mount again, he discovered 6 ohms of resistance.

I tuned the ATAS 100 to 28.300 MHZ. and keyed up the mic, only to find the HIGH SWR ICON Visible.

A member of this list suggested using RG-8 Coax, minus the center conductor. as a grounding source.

I am open to any and all suggestions as to how to lower my SWR for 10 meters.

BTW, I am uncomfortable running 100 watts so close to the drivers compartment, though mounting an antenna on the Expedition is quite difficult.

Has anyone had any experience with using a trailer hitch mount, as I have a factory hole drilled in the center of my bumper, for the installation of a trailer ball.

Thanks In Advance

Joe:
Keep in mind that DC ground resistance is irrevelant. You need the base of the antenna (shield at the mount) bonded to sheet metal as close as possible. Also, any nearby sheet metal should also be bonded together with short straps. You can use the braid of a coax cable for this, but keep it short. Considering that your antenna is close to the hood, be sure the hood has a couple good short straps to the metal near the hinges. I don't know about the Expedition, but some vehicles have metal pannels that aren't electrically tied together, however they manage to do that.
You can certainly use something tied to your trailer hitch, but make sure again that you get a good RF ground to the vehicle and you'll probably also want to use something to make the base of the antenna high enough to clear most nearby metal. I think there have been some receint comments on doing that.

Subject: [FT100] Just ordered FT-100!

From: "Timothy H. Heaton" <theaton@...>

Hi gang. I finally did it--I just ordered my FT-100! I want to thank all of you who I've pestered for information over the past three months. Special thanks goes to Dale (KG5U) who has answered several of my long queries. Thanks to this group, this is one of the most informed decisions I have ever made!

Since the going price on the FT-100 was $1099.95, I shopped around for prices on the XF-117C 500 Hz filter (the one accessory I really wanted). I found the best prices at HRO (most had a discount if you bought it with the rig--uninstalled--but several salesmen told me it was "plug-n-play" and didn't require soldering!--until I made them check it out--ouch!). Even among HRO stores the price varied ($149, $139, $130, $129, $125). I went with the lowest price (from Eric at the Atlanta store).

I'm sure you'll hear more from me as I explore all of the radio's features. It took me a month to master the VX-5R I bought last summer, so the FT-100 may take a year or more! :-) 73's all & Merry Christmas.

-Tim (WB7NMY)

We are all a part of this Lets make it as good as possible.

[Pres Waterman]

My installer measured the impedance of the ground at several places in the engine compartment of my Expedition.

[Pres Waterman]

Open the hood and look for a screw bonding sheet metal panel facing down right along the inside edge of where the hood closes. That is a nice RF ground and if the antenna base is grounded nicely you will have luck with the Expedition.

On 10m I have intermittent Hi-SWR shutdown but I think there is a problem with the rig.

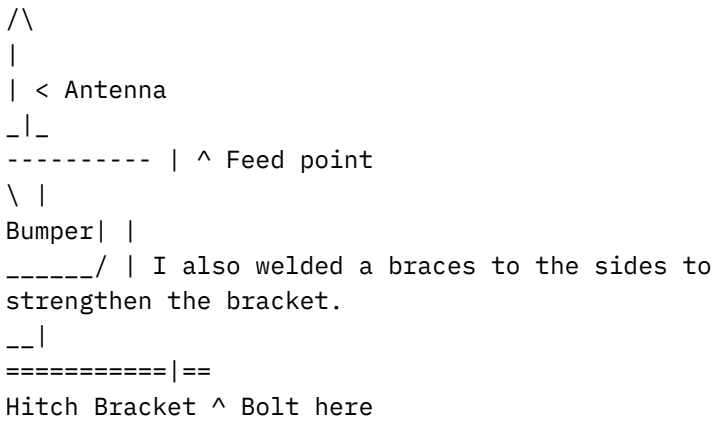
2259. Bumper Hitch Mount, Variation

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-22 15:01:01 UTC
From: mikef
Topic: 2259 Message: 2259

Another slight variation on the bumper hitch mount, is to get it moved up 12 inches or more.

I have a 97 Intrepid, with a removable hitch bracket (slides in and a pin holds the bar that had the hitch ball). I built a replacement bracket to hold my Hustler antenna that slides into the same mount, but also raises the antenna up about 14 inches. This get the antenna a bit higher over the bumper away from more of the car body. I also added a braid between the antenna mount and ground to assure a good ground for the base of the antenna.

The same extension can be adapted to some of the other antenna mounts where the antenna is bolted to the bracket after removing the ball, as indicated below.



Happy Mobiling.

Mikef

Here is a little trick I learned, if you have any RF feedback on any bands
with a 1.1 match with the ATAS.. Slightly detune the ATAS for a 2-3 bar
mismatch and this will usually uncouple the ATAS from anything on the vehicle
interfering with the ATAS, dont ask me why but it works for me when on
occasion, I get feedback in the rig... Richy

Hi folks,
I have been looking at both the new 706IIG and the FT100 for both mobile and portable operation.
I understand that the FT100 runs cooler, and the matching ATAS-100 antenna is a big plus. I have pretty much made up my mind to go with the FT100, and since I know no one who has one, I was interested in what info and comments I might find here.
Thanks,

Chris KD4IBI

Chris:

I suggust that you find a issue of CQ-VHF, Nov-99 issue verygood article on the comparison of the IC-706MkII-G vs FT-100. I just ordered a FT100 myself. I also have the
ATAS-100 which I got free when I got my FT-847. A friend of mine as one so I got to play with it.

2263. New FT100 owner

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-23 17:42:06 UTC
From: rickkoch@xxxxxxx.xxx
Topic: 2263 Message: 2263

Hello list members. Thanks for helping me decide to buy the FT-100.
I sat down at HRO with a 706Mk2 and the FT-100 side by side. I did
some comparisons on receiving weak signals both on HF and VHF
and found the sensivity similar. The S-meter readings were much higher
on the 706, but if I listened to a station that was just barely
distingishable on the 706, it was also just barely distingishable on
the 100. Same on VHF. I didn't try UHF. I like the way the 706 gives
s-meter readings for weak stations as I notice many stations on the
100 never register on the s-meter. No biggy. I also preferred the
tuning knob on the 706. I wonder if anyone sells a finger tip jog
wheel like the 706 has that can be adhered to the 100's knob? Again
no biggy. Other than that the features of the 100 seem more abundant
than the 706 and I got the 100 for $1089 at the local HRO here in
Salem, NH. I asked them (this was yesterday) for the latest serial
number, I watched the salesman look through some boxes that had just
come in and he pulled out a 9Hxxx. I had seen someone here post that
he bought a 9Jxxx so I was hoping to get the same. 9Hxxx was the latest
he could find. Anyway, so far so good. One anomoly I have discovered in
playing around was that the receiver sensivity drops drastically just
below 48.000mhz for a few mhz. Does anyone else notice this?

From looking at the CAT commands in the back of the manual I cant believe
that Yaesu hasn't provided a means of editing the 100's memories via CAT.
Over 300 memories and no way to back them up ???!!! I know Icom lets
you edit the 706 memorie freq's via CAT but doesn't let you edit the memory names, geeesh
what are these guys thinking??? Hopefully someone will figure out a way.

I'd like to use the rig as not only a ham xcvr but a swl and scanner. It
is nice to be able to individually scan any 1 of the 6 memory banks. I
hope to set each bank up for seperate interests. I notice that the NB
tends to distort on SSB if there are strong adjacent signals. The 706 did
the same thing. I haven't played with the NB level setting, just left it
at default. The DNF seamed to work better for general background noise.
The DBF is awesome for CW work. I love it. Another big plus for the 100.
Speaking of CW, I notice if I am listening to a CW station in mode CW
then hold the mode to switch to CWR I loose the station. I can tune and
find him again, but this seems annoying. Is there a way to set this up
so that I get the same CW tone but on the other side of the carrier?
Again I'm sure its in the menus somewhere I just need to dig in some more.
I'm going to attempt to make an RS232 cable for CAT use. Can anyone suggest
a schematic of such a cable?

>find here.

Chris,

Might I suggest a couple of things:

1. read the archives of this list group.

2. Go to the ARRL website and read the product reviews on the FT100 and IC706. They are both extensive and informative; both the published reviews and the even greater technical review that is not published in QST.

3. Focus your questions about the radio to specific things that people can respond to.

Now. In answer to your question, you can find a lot and all sorts of info and comments about the radio here and elsewhere.

I like my FT-100.

Happy holidays and enjoy whichever radio you finally decide on!

73,
dale, kg5u

Rick....when using the noise blanker on SSB with strong signals....I
suggest leaving the factory default NB settings and use the IPO and ATT
keys to reduce signal strength and eliminate distortion.....Dale KC2PZ

2266. Re: Interface of ATAS controls to conventional srewdriver

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-22 20:19:35 UTC
From: Gerald Gardner
Topic: 2249 Message: 2266

I have not built an interface yet - but it must be fairly straight forward. Initial testing shows 9 volts DC on the coax centre sends it one way - 12 volts reverses the direction - This is much like switching the mast head preamp via the coax feed and there are plenty of ideas for that - It's a bit surprising that Yaesu have not marketed an interface yet - there could be a lot more sales for that ATAS
I will let you know when my roundtoit has some spare time
Cheers
Gerald

I find the noise blanker distorts on local signals if it is set above 6 in the mobile, at 6 it does little to combat ignition noise but at 7 and 8 it really does the job. When using the FT100 for local ragchew set it for 7 or 6 and change the setting in the menu for RF gain control via the squelch knob when in SSB mode (remember to rotate the knob back when using 2m/70cm FM!!). I also engage the DSP and this helps the NB do its job at the lower setting (6). You can also engage the ATT and the one next to it (forget the name, rigs not in front of me..) to cut rx sensitivity when talking locally.
As far as working distant stations, I find they rarely overload the NB at 7 or 8.. The NB really shines for cleaning up the RX when DXing. I also make the USB RX carrier point slightly higher so when you engage the DSP the bass is less severe (as you will find out the audio level drops too much for mobile use without an external speaker). I then control my Tonal settings thru the Delco deck in my car. If you use the Rig in the house, you will (under most circumstances) not need to go crazy with the NB.
You can use all of the DSP controls even for voice (BPF and Notch can work for Voice as well as CW) . Two are adjustable by holding down their respective buttons until the FT100 shifts into the sub menu, the third is adjustable by going to the sub menu I believe. The best thing about the rig is that you can tailor the settings anyway you like. Along with the car stereo you can really make a super mobile station bar none.. I often throw my call out once and get a reply during a pileup (I guess they are looking for mobile contacts) This is without adjusting TX carrier point and DSP. I have my favorite FM station on one of the floating bands (there are two) and I can flip between my FM stations when I am bored and zip right back to the 20m band if I want to. Then make a call on 440 and QSY to 2m.. Mobile radio has never been better!!

2269. AM transmit garbled- fix???

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-24 05:38:12 UTC
From: William Mastop
Topic: 2269 Message: 2269

I recall reading about problems with AM transmit, where the transmission from the ft100 was garbled. There was a fix mentioned, but I don't remember it. Does anyone recall what the fix is, or the work around?

William Mastop (Ve7wjm) Vernon, British Columbia Canada

The work around is run the TX output power at 25 watts when in the AM mode.
All will be fine.

Happy Holidays!!

Thanks Dan,

Just a reminder for the Newbies, remember to add the Radio Shack stereo to
mono adapter to the end of the cassette interface plug to make all of the
speakers pass FT100 audio.. My adapter was damaged so I simply made this mod
inside the housing of the cassette adapter. Also check thru the archives if
you have a CD player, there are some modulators which can be added to pass
FT100 audio to the Audio deck in the car via the FM broadcast band... Happy
Holidays to all, and you can catch me on 10 meters most of the time here on
the east coast mobiling to work after 11am.. Hope to hear you!! Richy KB2CPW

2273. FT100 Round Table

First Happy Holidays to all:

I could really use some good advice. I have been a ham for about 1 year now and I am really enjoying the hobby. I just upgraded last month to general and my wife bought me the ft100 and the atas 100 tuning system for x-mas. Shes the best Sometimes Hi Hi. I would like to install this in a 1999 Ford Expedition. Can someone tell me where is the best spot for the antenna. The vehicle is a lease vehicle but I am good friends with the owner of the dealership and they are good about holes etc to a degree. Is there anything I should know when I am ready to have this installed by a local ham who also works for a 2 way radio shop and is very good with installs. I just want some pointers and make sure the right install is done but most importantly the antenna mounting is a concern.Can some of you more senior guys or should I say experienced guys offer me some help.
Many thanks
Mark KC2ELT Albany, New York

A good idea is to see if you can mount it to the spare tire carrier if it has one, if not look at the roof rack if it has one of those. Sometime you can fabricate a mount on the rack or under the mounting holes for the tracks rather than drill holes. The ATAS will be quite high at that point so beware when motoring around.. I also mentioned having a good aluminum fabricator make a mount for your aftermarket hitch or bumper mount hitch ball (if so equipped) to make a 2 to 4 foot extension with a mount for the ATAS at the top of it.. This will prevent any problems at the end of the lease since you really wont know if your friend will be there in a few years..
I am in the market for a New Beetle Turbo, I plan on installing a hitch mount in the rear for the mounting of the ATAS even though I have nothing to tow.. I feel that the mount will provide a sturdy mounting point for it and I will fabricate an extension off of that to make the ATAS higher all without doing any damage to the car or paintwork..
Regards.. Richy

2279. FT-100 not working on 6 meter FM?

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-26 01:10:32 UTC
From: wb4ktf@pipeline.com
Topic: 2279 Message: 2279

I tried to set up my FT100 on 52.525 FM and also a local 6 meter repeater (53.110/52.110)For all that I tried, I could not get the unit to transmit or even get the ATAS100 to tune (in any mode, either WFM or SSB). The rig gave me the "no transmit" icon. I checked the repeater offset and set it to 1.000 for 1 mHz offset. The "RPT" menu selector would not do anything, it should have allowed me to set the RP+ or RP- transmit offset, but would not do anything. I do have Menu #61 set for AtAS-1. It will operate and tune on 50.125 SSB. What am I doing wrong?

To simplify matters, if you do not have too much loaded in, try a soft
reset on it, this will place the radio and all settings in default just as
you received it from Yaesu. I dont have the manual handy but its in there...
Good Luck. Richy

Congratulations Mark, on all points raised!

I have had 2 Expedition installs done recently, and both with great results. I decided the roof was too high so I used a trunk-lip mount (no holes) on the driver's side of the hood. Ugly but effective. My technician was careful to run a short wire from the mount to ground into the fender. Also I used a piece of fishing line to guy the antenna tied to the lowest fold of the bellows running forward and under the hood tied to the underhood light so when the hood is raised the guy still works... don't guy to the main vehicle or you won't be able to lift the hood.

I have the remote control head mounted to the windshield above the rear view mirror and the extension speaker in the tray in the center console. The radio is under the passenger seat. Works sweet.

Boy, there are a lot of Expedition owners on this list!

I have a new FT-11 and am playing with it in the basement here to get used to some of its features before I install it later this week.

I am in Navy MARS and most of our HF Freqs are in the lower 10 mhz of HF. Yeasu sets the lower 10 mhz to LSB and the upper 10 mhz USB.

I need all of the lower 10 mhz to be USB. I do not see a option to turn it off or change it.

Can anyone help?

Thanks

Hi Dave,
All you have to do to change from LSB to USB is hold the MODE Button in more than 2-seconds. If you want you can program it in to memory so that the selected frequency will allways be USB or LSB. Other wise you will have to do it each time you use it.

73,
Lamr

Dave...I believe if you read the manual on page 33....press and hold the
mode button for one half second and the upper sideband will reverse to
lower sideband and vice versa....this is only for the band selected and
it will remember when you select that band again. If you want to go
back to standard sideband mode, just press the mode button for one half
second again.....Dale KC2PZ

Thanks Dale

I missed that in the manual.

Thanks again,

73, Dave Balko

Happy New Year to you and yours.

2287. FT-100/ATAS-100 Expedition Mounting Suggestions

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-27 01:08:11 UTC
From: WW4WJD@xxxxx.xxxxxxxxxxxxxxx)
Topic: 2287 Message: 2287

Hi Mark,

I like you, have been an amateur operator for 1 year now. I have my Tech-Plus and am working toward my General Class licensure.

My Yaesu FT-100 is about 1 week old. I too received it from my XYL as a Christmas Present.

BTW, I own a 1997 Ford Expediton XLT.

I live in Orlando Florida and had a "high end" stereo shop called "Sound Advice" install my FT-100 last week. The install looks quite impressive!

I chose to purchase the optional seperation kit and have the control head mounted, via a special hidden bracket, to the dashboard just below the ac/heat knobs, between the cigarette lighter outlets and dual cup holder. Please note that I have the bench seat arrangement, seating for 9.

I had the transceiver and mounting bracket screwed into the carpeting and flooring, directly below the center of the front bench seat. The FT-100 is physically grounded to the metal flooring in this area. With front bench seating, you will notice that the seat will only travel forward about 3/4 of the normal travel distance, due to the limitation set by the physical height of the FT-100 transceiver.

I also own the ATAS-100 and currently run a COMET B-20 dualband on the drivers side cowl, near the windshield.

I like the B-20 as it is almost the same height as the am/fm antenna on the passenger side.

The driver side cowl mount is a metal "L" bracket. I like this mount for the shear reason that the mounting holes are not visible, as they are between the hood and the fender. Second, because of the width of the inside of the hood, this is the only type of a mounting bracket that will work.

As opposed to spending money on a diplexer, I have chosen the Diamond Contour Mount, "K-600" and will be placing it on the rear hatch, in the center, directly above the brake light. Again the mounting screws will be hidden, on the inside of the center portion of the hatch.

The ATAS-100 works very well with the K-600 mount, in reference to obtaining a good solid ground. I have several fellow amateur's who are using the K-600/ATAS combination and they all agree.

Next...over to the hood. My installer had a difficult time in establishing a good solid ground for my "L" bracket, when using the ATAS, because the ATAS likes being mounted as close to the physical body of the vehicle as possible.

NOTE: The FT-100 REQUIRES and loves a good solid ground.

Sadly, my installer did make two small mistakes when grounding my FT-100's antenna mount, which has been corrected...

Stainless Steel sheet metal screws were what was needed...with good deep groove, bighting teeth.

Make sure that a dremel tool or a scraping tool is used to remove the paint "well" from the body where the ground is attained.

Good Luck...

Best Regards,

Joe Mattern

2289. 2 Mtr Repeater Hum

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-27 12:02:34 UTC
From: Rich Bay
Topic: 2289 Message: 2289

I just purchased a FT-100. WOW - NEAT RADIO!!

One small concern, I am getting a hum on several 2 Mtr Repeaters. The tone is approximately 120 Hz. I can easily cut it out with the DSP Filters (High Pass set at 160Hz). I don't hear it on other Radios (several handhelds and an old Kenwood). Other people are not hearing the hum. The frequencies are all between 147.0 Mhz and 147.4 Mhz. Some repeaters in this range do not have the hum.

Your thoughts on the following would be appreciated:

1. Am I hearing a tone on the repeater that others are not simply because the FT-100 has a better low freq response than some other radios?

2. Is this a problem with the FM Demodulation Circuit of the FT-100?

3. If you have seen this issue what are you doing about it?

Beyond this issue I have tried many features of the radio on 160 - 10 and 70cm. It works great, many QSO's, great reports, excellent SWL, VHF Scanning, TV Stations, etc. So far none of the various problems I have seen on this reflector. All my test have been conducted in a fixed installation using a 160 Windom, a 3 element beam and a Diamond 2mtr / 70 cm Vertical. (I'll try mobile soon)

Your response will be appreciated.

Sincerely,

Rich K0FUN

>>

You are probably hearing the PL used by the Ham on the input which then is passed along to the repeater rx and tone decoder, sone repeaters do not do a good job of filtering this tone out (if at all) and as it passes thru the rx to the tx it gets altered by the various stages in the repeater, also some repeaters allow the tone to pass thru or re-encode the tone for the users who may want to quiet their radios with decode on a freq where another repeater 100 miles away may be heard. I hear this also mostly when I pipe it thru the car stereo. The 2 meter rx audio is very good on mine so I think thats what you are hearing. You can tailor it out with the dsp and other controls but there is hardly anything wrong with your radio. Good Luck, Richy

2292. FT-100 Keypad

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-28 00:43:01 UTC
From: jenfosk@xxxxx.xxx
Topic: 2292 Message: 2292

Hello everyone,
I am just starting to do some research.
I am looking into the FT-100,FT-847,and IC-706 series type of
radios that "do all" as possibilities.
Has anyone seen where a manual for a FT-100 is available for
download? Did't see it on the Yaesu site.Some makers offer this.
It would help and answer alot of questions.
One question I have just from the pictures in catalogs is,
Is the keypad on the mic used for direct entry of freqs(maybe DTMF)?
I am comparing the FT-100 to the IC706MkIIg and thought this might be
a feature I know the 706 doesn't have.
Thanks in advance
Kyle KC2DYS

Hello Kyle

I just got my FT-100 and nowwhere in the manual does it talk about direct frequency entry with the mike keypad. I have not been able to key in any frequencys either. I would not count on that as something to look forward if you get the FT100. I also have the FT-847. It does have the keyboard to enter the freq with and it is nice.

2294. 4000 miles w/new FT100 & ATAS

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-28 01:30:09 UTC
From: David Feldman
Topic: 2294 Message: 2294

Just finished a 4000 mile driving trip with a new FT100/ATAS (antenna mounted center on trunk lid of large sedan). Very pleased with results - no major DX or anything but the convenience of auto QSY confirmed that the rig was a good choice for me. The only trouble spot was during several hundred miles of driving through southern idaho in sub-20 degree frozen fog conditions - the ice accumulation on the antenna (1/4"+) made the rubber boot really distort as it was retracting (but it was able to break the ice and retract successfully); after the bout of ice fog the antenna had trouble on 40M (unstable SWR) but after several hours of sunlight the problem disappeared.

Date: 1999-12-28 12:21:48 UTC
From: gary@xxxxx.xxx
Topic: 2295 Message: 2295

I plan to use my new FT-100 in many locations. For example I will use it mobile occasionally, in the woods while camping, and at home (most of the time). In this light I think the FC-20 may be a useful accessory but I cannot find any substantial information about it. Does anyone have any experience with this tuner or know where I can find additional information? For example does it work via switched L-C circuits and associated relays or does it use motors to turn variable capacitors and inductors? How much current does it draw? How big is it? Can it tune a 102" whip on my car or is the mismatch too great on most bands?

BTW, although I just received this radio last week I am having a ball with it. Very impressive technology.

Thanks in advance for any insights.

Gary...stay away from the FC-20....It doesn't have a very wide matching
range....Get a LDG AT-11MP...it is remote mountable, so you can put the
unit very near the antenna and keep the RF out of the interior of the
automobile....Dale KC2pZ

2298. Crossband Repeater

Hello to the Board,
I was just wondering if the FT-100 has a Cross-band repeater function between UHF and VHF. Can you set it up as a Cross-band repeater in your car or something and talk through it with a hand held like you can with many Dual band VHF/UHF rigs?

Thanks,
Mike

I am thinking of selling my Ft100 (Good radio, but I do not operate mobile HF enough and I want the Kenwood APRS dual-bander). I have not seen many for sale and I wondering if anyone has any ideas why? I was actually looking to see what a comparable price was, but I have not seen any for comparision.

So, I am interested in hearing from anyone that has purchased an FT100 used?

Thanks,

Tom NY4I

The only problem I see is keying the radio at low power to let the tuner work.
Easy to do in the shack, not so easy while tooling down the highway.
The IC-706 tuner that was mentioned does the trick for the ICOM,
but now we need something like it for the FT-100.

Hi,
I ve had my Ft-100 & atas antenna now for 2 weeks...atas worked great at first but
then would not move when the tune button was pushed. Someone here suggested pushing the pitt button and pushing the up/down buttons on the radio to make it move. Well this did make the antenna go up and down but it still will not auto tune.
Anyother suggestions???????????????

Hi Bill,
Are you sure?? Is this April Fools early? Maybe I incorrectly read
your post. Yaesu FT-100 for $699 at HRO or $669 at RT Systems!

I just checked RT Systems web site (http://www.rtsars.com/index.htm)
and it says $1079 with all discounts

HRO's site (http://www.hamradio.com/) says $1099.95

Hi Charles... I just re-read this thread and I believe you are
correct. Whew! I was running some crazy thoughts through my head
trying to figure if I could come up with $700 by tomorrow morning by
selling my parrot and renting out my ex-wife!

Thanx for helping me stop the lunacy!

Date: 1999-12-30 06:11:29 UTC
From: SS409SS@xxx.xxx
Topic: 2305 Message: 2309

In a message dated 12/29/1999 10:15:22 PM Eastern Standard Time,
Frosty9603@... writes:

<< Hi,
I ve had my Ft-100 & atas antenna now for 2 weeks...atas worked great at
first but
then would not move when the tune button was pushed. Someone here suggested
pushing the pitt button and pushing the up/down buttons on the radio to make
it move. Well this did make the antenna go up and down but it still will not
auto tune.
Anyother suggestions???????????????
Mike AA8JI >>

You first must check the ATAS settings in the menu. I prefer to use my
ATAS only for HF thru 6m and a dual band antenna for 2m/440 as the ATAS must
cycle thru a reset mode (for lack of a better explaination) every time I went
to UHF or VHF. If you are having trouble, try this:
1. Drive to your favorite hot dog stand and park your car
2. Set the radio to the desired band of operation and set the mode you
desire.
3. Hit the tune button and quickly step from the vehicle
4. Go get a Yoo-hoo and two hot-dogs with Mustard, sauerkraut and onions
(you must get this combination and remember the napkins, Yaesu will
void the remaining warranty if any condiments get lodged between the keys!!)
5. After eating the Hotdogs, you may return to the vehicle and you will
find the ATAS tuned and ready to go.
6. The problem is that the ATAS sometimes needs to cycle thru a "tune" to
relocate the antenna. The Hot-dogs help to take up the time it takes to do
this.
A quick call to Chip Margelli revealed that the next printing of the Yaesu
FT100 manual will contain this update along with a few coupons for an 8 pack
of Sabrett hotdogs at 35% off. All FT100's with serial numbers after 9J will
contain within the box... Chips famous homemade mustard (revealed at the
Dayton Big BBQ Cookoff last year) with its special blends of herbs and spices
only known to him and a few select Yaesu Techs.

PS this will not work with Waffles and Maple syrup nor poached eggs so if you
are a morning drive type of Ham, substitute an Egg Mcmuffin or two instead of
the Hot dogs....

I hope this helps.... Richy KB2CPW

Thomas,
got mine from Burghardt's just before the rice decrease, by the way which has gone back up. $1069 used from a dealer-high buy reliable. Some people just like to tinker and move on, that is why so many are out ther.
73,
Jack

2312. Hustler Antenna Question

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-30 15:53:23 UTC
From: mikef
Topic: 2312 Message: 2312

Fellow FT100 owners.

I know that most of you are into the ATAS100, but I'm still using the old standby Hustler antennas.

I use the antenna as:

10 Meters 37" whip on top of mast (Full quarter wave length on 28.5 MHz

15 Meters 7" whip (exposed) on the 15 METER RESONATOR

17 Meters 16" whip (exposed) on the 15 METER RESONATOR

20 meters 36" whip (exposed) on the 15 METER RESONATOR

40 meters Standard 40 meter resonator/whip

80 meters Standard 80 meter resonator/whip

Additionally, I use a torrid core wound to allow matching the lower feed impedance (mostly on 40/80 meters) at the base of the antenna. The 10/15/17/20 meter antennas work well with the 50 ohm feed impedance.

I've seen some mods (years ago) where they sold a bracket to mount 3 resonators on the same mast. Seems like a lot of mass (and wind load) to mount on the top of the mast, not to mention it looks like xxxx.

Incidentally, I use a VHF/UHF dualbander for those bands, and the Hustler is mounted using a home brew trailer hitch mount to mount the mast to the car.

Note that I use the 15 meter resonator for 3 bands. My current thought is to try to find a way to mount all 3 whips on the same resonator for a full 3 band antenna. I'm just not sure how to go about mounting the extra two whips onto the resonator, and still allowing a reasonable amount of adjustability, with strength. I had figured on mounting them "in-line" to minimize wind resistance.

Does anyone have any ideas on how I might mount the extra two whips to the resonator?

Mike

2313. Mobile Lip Mount Recommendation

Yahoo group: FT100 (1998 — 2000)
Date: 1999-12-30 16:31:52 UTC
From: k7zo@xxxxxx.xxx
Topic: 2313 Message: 2313

Santa brought me a FT-100 and now I need to get the thing mounted in my car. I am planning on getting a ATAS-100 to go with it, but I am wondering what mounts have been working with it. I know the ATAS-100 is pretty big for a mobile antenna, so you need a "beefy" mount. I am interested in lip type mounts as I really don't want to drill holes. I know the big 3 or 4 magnet, mag mounts, work well, but I am hoping for a lip mount.

Thanks in advance.

Scott/K7ZO

Scott, take a look at the Diamond K600M, trunk lip mount. I use it on the XYL's car for the ATAS100 or sometimes a dual band VHF/UHF antenna. This mount has four set screws to keep the mount on the trunk. be sure to clean paint off of the under side of the trunk lip for great ground connection for ATAS100. Good luck, 73s de John W8JW
.

Scott,

The Comet CQ5M works very well, and gives you the ability to quickly remove the antenna... without having to unscrew it each time.

From: dale brown
Topic: 2312 Message: 2318

Mike...I have a hustler antenna and I made an adapter to mount three resonators on one mast. I cut an equilateral triangle 8 inches on a side out of 1/8" aluminum plate. I drilled a 3/8" hole in the center and on each tip about 3/4" in from the apex. I then put the tip into a vice and bent over about 1 and 1/2 inches to about 30 degrees. This worked very well with my FT-890. I bolted the hustler mount on a 2 inch square tube and stuck it in the receiver hitch. The wind load is not too bad, but to be safe (above 70 mph) I tethered it to the luggage rack on the top of the vehicle....Dale KC2PZ

2319. FT-100 Installation

Hello all,
I think that I am about ready to order my FT-100 now. I just can't wait any longer. I'm probably going to miss the discount price, but that is okay. I wanted to give Yaesu and the dealers some time to flush out any bugs or any old versions of the radio lying around. My question: Is the radio for the most part pretty solid now? Have they fixed the problems with the finals and any others that seem to be common with the FT-100? I'm working a contract here in Bosnia and I really don't want to have to hassle with shipping it back 2 weeks after I get it. I just wondered if she was pretty safe to get yet. Looks like one heck of a radio.

Thanks,
Mike N7XGN

The only problems I've had have been with the IC burning out in the ATAS-100, replaced under warranty. Remember every price is negotiable. I just paid 293 for a Yeasu VX-5R -on sale for 314.95.

Hello all,
I think that I am about ready to order my FT-100 now. I just can't wait any longer. I'm probably going to miss the discount price, but that is okay. I wanted to give Yaesu and the dealers some time to flush out any bugs or any old versions of the radio lying around. My question: Is the radio for the most part pretty solid now? Have they fixed the problems with the finals and any others that seem to be common with the FT-100? I'm working a contract here in Bosnia and I really don't want to have to hassle with shipping it back 2 weeks after I get it. I just wondered if she was pretty safe to get yet. Looks like one heck of a radio.

Thanks,
Mike N7XGN

I recently subscribed to the list and I'd like to know more about the IC burn out issue. My radio's serial number begins with 9H.

Just to note, if you are using the ATAS-100 Antenna for HF/6M & 2M/440 operation using a duplexer, I recently discovered that you need that Menu #61 needs to be set to ATAS-1 (for one antenna solution). ATAS-2 should be used when ATAS-100 is being used on HF/6m alone or in conjunction with a second antenna for 2M/440.

Also, in my humble opinion, I have discovered that 2M/440 performance of the ATAS-100 can be easily beat out by a separate 2M/440 antenna is probably a more cost effective solution.

As I recall, the menu 61 is supposed to be set to ATAS-2 when used with just the ATAS-100 with duplexer. I may be mistaken. How can you say it is more cost effective to use separate antennas when you consider the cost of a duplexer (~65.00) vs a decent dual band antenna with mount (+100.00)? I don't understand.

Rene,
Thanks for the email. There is an error in the manual. The easiest way to remember the correct settings is: ATAS-1 for one antenna (w/ duplexer) and ATAS-2 for 2 antennas (no duplexer).
I hope this helps.

From: Rene Campbell
Topic: 2320 Message: 2330

I have to be careful how I approach this subject.

In my humble opinion, you can buy a dual band high gain antenna and mount for a little more than a duplexer. A duplexer would attenuate the signal by a half dB on HF/6M & 2M/440 on a unity gain antenna. If performance is a factor, the increased cost is almost justified.

Don't get me wrong, I have my ATAS-100 connected via a duplexer right now, however I am reconsidering the solution.

I would have to vote for two antennas also.
I have had my FT-100 for about one year now and have used it with the ATAS alone and with the ATAS and a dual band 2-m/70cm antenna.
I travel in a rural area and have found that a separate VHF/UHF antenna will out perform the ATAS alone.
Another point to consider is the wear and tear on the ATAS. If you do a lot of switching from VHF to HF, then each change requires an ATAS motor start and stop. With the dual antennas if I am working 40 meter and want to check a VHF repeater for a while when I return to 40 meter I'm all setup to go.

From: mhodas@xxxxxxxx.xxx.xxx
Topic: 2335 Message: 2335

Just a curious operating observation. I use a Diamond duplexer, thus use the ant for all bands. Menu 61 setting is 1. I have found quite accidentally that I do not necessarily have to fully retract the antenna in order to operate on eith 2M or 440. In other words, if I am tuned on 20M and switch the radio to either 2M or 440, I can immediately transmit without retuning and the SWR is very low.....ie, 1 bar on either band. If I retune (fully retract the antenna), the swr does not change and the performance seems to stay the same. I think it is strange....any comments? Thanks. Mike K8YOY

See the FT-100 manual pg 64. No tuning is required for 2m/440 operation.
It suggests the antenna be fully retracted.

2337. bracket for the face plate

Yahoo group: FT100 (1998 — 2000)
Date: 2000-01-02 00:17:25 UTC
From: cnelsen@xxxxxxxx.xxx
Topic: 2337 Message: 2337

Jim,
I removed the BC radio that also had a small "glove box"
below it. I fabricated a front face plate that tied into the same
mounting points as the "glove box". It is made out of 1/16"
steel plate that has two side rails welded to it. The top view
looks like the letter "Pi" (but with a straight top). The two
side rails mount the face plate using the same mounting bracket
as the BC radio and glove box. I milled into the face plate a
opening to receive the front panel mounting nest of the FT-100
such that the remote head would be almost flush to the face plate.
I then welded a (squared off) "U" shape bracket to the back side
of the face plate to support the back of the FT-100 panel
mounting nest.

Top View looking down
| |
| | <- four mounting holes
|________|
--/--------\-- <- Face plate

Painted it and installed it in place of the
small "glove box". I moved the BC radio to the lower position
to make the FT-100 more accessible at the top of the radio stack.
Sounds simple, but it took me two days to do.
Needless to say I have an extensive workshop with a mill,
lathe, welder, plasma torch, etc.(along with a 160Hp amateur
home built helicopter along the side wall as work in process).

From: worsley@xxxxx.xxx
Topic: 2338 Message: 2338

Hello All,
A couple of questions,(not to be taken as complaints):

I am setting up my new FT100, and have found no way to adjust the volume (not pitch) of the CW sidetone. It seems a little louder than I'd like. Any note that I may have missed in the manual?

Also, it would appear that when I set the power level for CW at 5 watts, then switch back to SSB, that 5 watts is now the SSB power, not the 80 watts I had been running. So, power setting is not saved as "CW or SSB specific"? There also seems to be no use of the power numbers one has on the display during transmit, unless the nearly microscopic hairline ALC indicator is making reference to these numbers (10 50 100W)

This little radio seems to be everything everyone said!
Many thanks to all who replied to my earlier "pre-owner" questions.

From: Dale L. Martin
Topic: 2338 Message: 2341

Chris,

I think what you will find on the meter scale is that the numbers represent the percentage of full power at that mode and frequency; not actual power output value.

The SSB instructions say adjust mic gain for 3-4 dots of ALC. I haven't ever done SSB on the radio yet, so can't say exactly what you may see or how much mic gain it might take to get there. But, on CW, and using the SWR function of that scale, I have found that (while it's hard to see), I can tell quickly just by relative length of the SWR (ALC) meter representation that I am okay or not okay. I sure wish Yaesu had more evenly split the two scale sizes or made the meter selection for the large scale selectable.

Check the power output settings for menu items 21, 22, 23, 24. For instance, if you set CW for 5 watts out, SSB will then be 5 watts out, until you switch to SSB mode and re-set the power level to something different. Then, CW should remain at 5 watts and SSB will be the new reset power level. Try that.

As to the sidetone level adjustment, I think it's an internal board-mounted control. Looking at the schematic, I found a small pot on the Main Unit board. It seems to be the only variable resistor I could find associated with the audio output amp.

On the Main Unit schematic, it's located in about 3" from the bottom of the page and 1.25" from the right hand edge of the page. VR1004 feeds beep audio to the input of Q1069, which feeds the speaker jack/speaker connector (Pin 8, J1002). The VR1004 source is through pin 17, J1017 from the pin 4, J7006 (control unit), to pin 48 of Q7010. (thank god for a magnifying glass). I recommend you call Yaesu Tech Support to confirm with them exactly how to adjust sidetone level.

2342. Ignition RFI in Honda Accord with FT-100

Yahoo group: FT100 (1998 — 2000)
Date: 2000-01-02 20:15:13 UTC
From: wb4ktf@xxxxxxxx.xxx
Topic: 2342 Message: 2342

Just an up date to FT-100 users with Honda Accord EX. I had a terrible
Ignition noise problem in my 1995 Honda that made HF and 6 meter work with my
FT-100 a real challenge. Here are the results for others with real bad
ignition noise:
Well I did change out the distributor, rotor, put in new "expensive" silicone spark plug
wires (about 1 Kohm each) and all that did very little to reduce the noise.
So yesterday I ripped up some good RG213 coax and installed the shield over
the 4 plug wires and grounded the shield at the plug end to the engine
block; this helped reduce the noise from S5 to S3 on the HF bands. The
noise on 6 meters is still about S6. Looks like I'll have to try shielding
the distributor next.
Thanks to all for helping though, everything is appreciated.

Date: 2000-01-02 23:53:05 UTC
From: Dale L. Martin
Topic: 2346 Message: 2346

The other day, while fooling around in the garage, my cordless phone I carried out there rang and I had a short conversation with a friend. Then, as I looked at the car, I realized that in it was my FT-100 with it's gen coverage receiver.

Curioisity drove me to tune through the VHF band while calling my work phone (I was sure no one would answer it, except my phone mail).

Sure enough, in quick order, I found the handset transmit and the base transmit frequencies. Loud and clear. It was a reminder to me that cordless phones are radios and, as such, conversations of a personal, private, and/or business nature are susceptible to being picked up by nearby listeners. I've always felt and tried to remind myself and friends to be cautious about their conversations on cordless phones.

One of the television news magazines carried a report about and interview with a guy who was found to have been compiling detailed personal information on his neighbors by scanning the telephone frequencies.

I may be wrong, but in my experience, the ATAS 100 works just as well
(or badly, depending on your point of view) in ANY HF position.

So I don't bother to "retune" (i.e shorten) the antenna to use 2M.

One thing I do notice is that my ATAS doesn't move if it's below freezing.

Right, I am aware of the above, clear in the manual.

>I sure wish Yaesu had more evenly split the two scale sizes or made the

That is what does *not* happen and I thought it would. When I return to
what I thought would be a SSB setting of 75, it had changed to the 5 I
had just set for CW. This is no big deal for me, I'll just change power
in the Menu#21(HF) as I shift from CW to SSB.

>
> As to the sidetone level adjustment, I think it's an internal board-mounted
> control.

After reading the manual a couple of times, I had pretty much decided
this too. I am saving your info in the location of the pot, and will get
in touch with Yaesu if I find I can't get a long with the volume of the
sidetone....but with the headset I am using (Heil), and the attenuator
on page 23 that I put together, it is not as loud as I first heard it on
the external speaker.
I don't feel very handy when opening the case on a piece of micro-mini
ham gear!

Thanks again Dale,

Chris KD4IBI

From: GARY GADWA
Topic: 2352 Message: 2352

ATAS-100 Users,
Just read that the ATAS-100 doesn't work below freezing. Well just happens that my QTH is Stanley IDAHO (renowned for being the coldest spot in the lower 48).
My Yaesu ATAS-100 does work (Up and Down) Auto Tuning daily below freezing.
I must admit, I do let the sun hit the antenna usually till about 9 am before I do any autotuning. Just the same many days in December 99 barely got above the lower 20's and several closer to zero. My ATAS-100 handles daily frequency excursions very nicely.

2355. Round stickers denoting updates?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-01-03 07:22:50 UTC
From: piperbill@xxx.xxx
Topic: 2355 Message: 2355

On an earlier message I just read in the archives, someone mentioned that the little round stickers on the FT-100 box denote updates to the rig.

I just received my FT-100 and while it's brand new, and purportedly straight from a recent shipment from Cerritos (I specifically requested a high serial number), it's only a 9E0xxxxx number. Anyway, I'm wondering if anyone knows exactly what the stickers mean. I have a gold, blue, and green sticker on mine.

Thanks!

Bill, WK6A

Alan,
I am using a Heil headset with #5 mike element in the boom
Plugged an AD-100-8 conversion cable into the mike jack, then an AD-1-Y
cable into that. The mike plug goes into the 1/8" jack (on the AD-1-Y)
and the foot switch is plugged into the 1/4" PTT jack (on the AD-1-Y).
The earphones plug into the attenuator shown on page 23 of the manual.
This is all Heil equipment, except for the Radio Shack foot switch.

Gary et al,

That was MY post and I was referring to MY ATAS100. It just doesn't like the cold. I would think there is a small fracture or soldering problem on the PCB that opens when the ATAS is cold.

Does anyone know how to take it apart? I've removed the boot and can see the fiberglass coil assembly but I've never unscrewed anything to check out the rest of the unit. From the design, it looks like you might have to wrench it apart.

Mike - if you can clue me in, I'd appreciate it. I'd rather not send it in because I don't think it would be considered under warranty.

My experience using the ATAS in a drive thru southern Idaho is that it was somewhat prone to unstable SWR but was definately movable (even crunching through 1/4" of ice buildup on one side due to driving in frozen fog); another leg of the trip over the rockies had it movable just above zero F.

Dale:
Baby monitors are also a significant security risk since they are always on, can generally hear more of the house than most people expect and transmit quite a distance. When I had my Internet Company we would always ask people who were setting up an account if they were on a Cell phone, portable phone or near a baby monitor before we discussed personal information, particularly ID's and passwords. It was amazing the number of people who were and didn't have a clue that anyone with a scanner could tune in.

2363. false high swr readings

Yahoo group: FT100 (1998 — 2000)
Date: 2000-01-04 09:29:36 UTC
From: W1RAM@xxx.xxx
Topic: 2363 Message: 2363

From: F/W1RAM (W1RAM@...)

I have been reading for many months stories about people getting flickering false high swr readings, sudden output power drops after having earlier gotten full output and low swr readings, and reported shielding problems with the output circuit of the FT-100. Since September, I have been experiencing considerable frustration in getting my FT-100 with FC-20 tuner to achieve full output and successful tuner operation on 10, 12, 15 and sometimes even 17 meters. Often, I could get the carrier (around 50W) to make the tuner tune successfully on these bands. But as soon as I started to talk, the SWR readings went haywire and output dropped to minimum. Amidon toroid cores anywhere on the coax line did no good.

But I recently stumbled upon a "fix." Or so it seems. Enter the MFJ-914 Auto Tuner Extender ($50). I have it inserted between the FT-100 and the tuner. It has a seven position switch that I just set and forget on position #4 ("D") for all bands. I have no exact explanation for why the MFJ solved my swr readings problem, but I surmise that it provides some necessary isolation between the radiation problems of the rig and the tuner. Now I can simply hit the "tune" button and work 160 meters (yes, 160) thru 6 meters with 1:1 SWR and full outputon my 80 meter Carolina Windom. The way the FT-100 was supposed to work. And I never had to deal with the boys in Cerritos.

Disclaimer: I cannot promise the MFJ can solve everybody else's problems, but it sure worked for me. Sorry I don't have 2M or 440 antennas to see whether the MFJ helps in any way on those bands, although its specs cover only 1.8 to 30 MHZ.

Topic: 2368 Message: 2368

I put my FT100 on sale at eBay if anyone is interested.

Tom NY4I

Title of item: Yaesu FT-100 HF/VHF/UHF XCVR + Remote Kit
Seller: toms@...
Starts: 01/03/00, 15:18:15 PST
Ends: 01/10/00, 15:18:15 PST
Price: Currently $812.00
To bid on the item, go to:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=230187430

Item Description:
Breaking new ground in the field of micro-miniature transceiver design, the FT-100 is the only miniature mobile transceiver providing coverage of the 160~6 meter bands plus the 144 MHz and 430 MHz bands, Combining a unique, user-friendly front panel with high-tech features like Digital Signal Processing, the FT-100 provides performance capability well above that of many base station transceivers, ideal as a compact mobile, vacation, or expedition transceiver, the FT-100 provides wide frequency coverage and operating versatility for every operator's requirements.

Features Frequency coverage:
RX :100 kHz - 970 MHZ
(Cellular/digital telephone
freqencies are blocked)
TX :160~6 Meters, 2-Meters, 70 CM
Power output: HF/50 MHz 100W , 2-Meters 50W , 70 CM 20W
All Mode Operation: SSB, CW, AM, FM, AFSK, Packet (1200/9600 bps)
Detachable and Remoteable Front Panel
DSP Bandpass Filter, Notch Filter and Noise Reduction
IF Noise Blanker
IF Shift
Two Antenna Jacks (HF/50 and 144/430)
VOX
Dual VFOs
Built-in Electronic Memory Keyer
Speech Processor
Built-in CTCSS Encode/ DCS (Digital Coded Squelch)
Automatic Repeater Shift (ARS)
300 Memory Channels
Quick Memory Bank (QMB)
Smart Search(TM) Automatic Memory Channel Loading System
Auto-Range Transpond System (ARTS)
Bright LCD with Multi-Function Display Menu

Buyer pays shipping and insurance (around $30 depending upon location). Certified funds or Personal Check (check must clear first). This radio is in great condition and I hate to sell it, but I bought the new Kenwood APRS mobile and I do not need both radios in the car. This price includes microphone, manual, brackets, power cable, and remote kit. The rig is shipped in its original box.

On 01/03/00 at 15:44:27 PST, seller added the following information:

FT-100 discovery for me anyway.
Hidden Display Icons.....

Something I discovered, if you turn on the radio while holding the select knob in you will get a different display. Now if you turn the main tuning knob you will see all of the graphic displays possible in the Radio. Power on/off , ant tune, vswr 0 or X etc. Several that apparently aren't used.

This may be old hat to some but it was new to me so thought I'd share the latest display wizardry.

Gotta Love that FT-100 and ATAS-100

Date: 2000-01-05 01:32:30 UTC
From: PowerWerx
Topic: 2371 Message: 2371

List:

We recently had a gentleman from the FT-100 onelist order the OEM connectors from our www.powerwerx.com web site thinking that the connectors offered were compatible with the FT-100. The connectors we currently have in inventory are for "Regular" 2 meter, 440, 1.2 gig, 6 meter mobile radios currently being shipped by Yaesu, Kenwood and Icom.

We will, however, have the special "OEM" power connector for the Yaesu FT-100 with in a1 month so you will be able to build extra power cables for the
FT-100 radios.

We will post our inventory when they arrive.

Thank you in advance for your patience.

In my office I have a top-of-the-line Panasonic 900 MHz/2.4 GHz digital spread spectrum cordless phone, and the instructions claim that evesdropping is impossible. But one day while working in another part of the building I found myself listing with perfect clarity to a colleague nearby with the same type of phone! Even the best ones aren't immune!

Topic: 2366 Message: 2374

My ATAS 100 also has a hard time tuning the top of 10 and 6m. It tuned all the bands fine when mounted on a 5' mag mount, now it is on my utility rack (Thule) and has a 4" copper braid to ground. This setup actually allows 40m thru 10m lower half to tune flatter swr's but the 4" longer "antenna system" detunes the top of 10m, 6m, and raised the resonance of 2m & 70cm (I use a separate antenna for those bands). I have used both a 5" mag mount as a capacitive ground (2 1/2" mag did not work) and a direct ground with similar results (in this configuration). Triple mag mounts often detune this antenna because the distance from the magnets to the mount.

2375. Hi swr readings

Yahoo group: FT100 (1998 — 2000)
Date: 2000-01-05 11:25:38 UTC
From: Nan & Tony Middleditch
Topic: 2375 Message: 2375

Hi All
My FT 100 would give intermittent hi swr readings on 70 cm as well as the top ent of 10 metres and also on 6 metres. It went back to Yaesu for 6 weeks and came back all OK.
The Yaesu techs replaced the "RF deck".
Just prior to Xmas, the same faults re-occurred but the 70 cm fault was permanent.
Other faults have been erratic VFO operation when using the select knob, poor af output - volume usually turned up to max in the mobile. Also noted poor VHF and UHF sensitivity. I am into weak signal VHF / UHF work from both home and mobile. The FT100 was hopeless without an external preamp, which amongst other things, increased the audio level to something that was readable.
I returned the FT100 on Xmas eve and now have an IC706MK2G, having owned the FT100 for 6 months. The VHF / UHF reciever on the 706 is far superior that which was in my FT100. This doesn't mean to say that all FT100s are deaf however.

All the best, Tony VK3CAT

I've gotten my ATAS-100 back from Yaesu, seems like they replaced the lower assembly. Only thing is that it now seems like my receive sensitivity is much lower. Either that, or the bands have been very quiet. I'm able to send & receive, evidenced by contacting antarctica last night, but hear very little activity. Anyone else see this after having an antenna repaired, or am I off base, and getting things back up in a "quiet" time?

73,

Howard, N2JIH

Howard,
Using the FT-100 on CB is illegal (as you should know).
One of the few things that makes ham radio a better place than
the CB bands is a respect for the law by most hams.
If you want to transmit on CB, buy yourself a cheap CB
and stay legal.

2386. High SWR/Shielding Problem

Yahoo group: FT100 (1998 — 2000)
Date: 2000-01-09 18:26:12 UTC
From: WW4WJD@xxxxx.xxxxxxxxxxxxxxx)
Topic: 2386 Message: 2386

Fellow FT100 Enthusiasts,

My new FT-100 is now 2 weeks old.

Previously, I posted about the "grounding" problems I had in conjunction with having my FT-100 wired into my Ford Expedition.

To alleviate the grounding problem, I chose the Diamond K-600 on the rear hatch in conjunction with 1/2" braided ground strap.

Since Day 1, I have been able unable to utilize 10 meters due to the presence of a HIGH SWR ICON. As you can imagine, this is especially frustrating to me as I recently passed my code to become a Tech-Plus and received this radio as a Christmas Present.

I strongly feel that my FT-100 has the "shielding bug". Why, because on 10 meters, utilizing the FT-100 in conjunction with a dummy load, the SWR icon is present.

I have an appointment to return my FT-100 to AES in Orlando, on Tuesday Morning.

AES wants to call Yaesu to verify if they are familiar with this bug and seek advice to how to fix the problem, either by repair at AES, or by an exchange with a new FT-100.

My question: has anyone brought this shielding bug to Yaesu's attention and what was their reponse to this concern?

Thanks In Advance,

Joe Mattern, WW4WJD
Orlando, Florida

From: Jfering@xxx.xxx
Topic: 2386 Message: 2387

I had the high SWR problem and resolved it by making sure I had a good ground at the base of the antenna and at the radio and by changing the length of the coax. The same things cured an RF problem on 20 meters too. While I had a low SWR meter reading at the rig on 20 meters, I got reports of lousy audio -- descriptions of which sounded to me like RF getting into the audio circuit. After changing the length of the coax and making sure I had good grounding at both ends of the coax, the problem disappeared. My FT-100 has a 9E . . . serial number and was purchased at Dayton last May. I have had no othert problems with it. It has not been in to Yaesu. I am thinking of sending it in to have the 6 KHz AM filter installed and assume they will bring it up to date with any service mods at that time. If yours is new, I suspect you already have those mods.

Something that you may want to check, is where the resonant point of the antenna is.

If you have a noise bridge, you can check where resonance is by where the dip in the noise exists. It's the best way to find resonance and the input impedance of your antenna. MFJ sells them, as well as other manufacturers.

I would guess that all rigs have the problem. It may be the antenna system that brings it out.

I've returned my FT100 to Yaesu for the shielding mod, but still have problems with it using my MFJ tuner. I get a good low SWR, start transmitting and the SWR goes high. I've also set the power to a low value (~25 watts) and retuned. Then shortly after, the power HIGH SWR icon comes on and the power output goes high. I think that there's an oscillation in the power module that they still don't have fixed.

The mod may help, but I don't feel it will cured it.

You may want to wind the coax at the antenna around a ferrite core.

Mike

I am selling my 2 week old ft-100 and atas-100 combo. I bought it thinking I would get
back into ham radio, but I just have not used it that much, now I would like to sell it.
It worked great on all the bands. I never had any problems with the atas-100 tuning - it always tuned up right away. The radio is in imaculate shape, no scratches and very little use(less then 10 hours of on time). I paid 1400 hundred from ham radio outlet. I will sell the combo for 1250. I think this would be a great deal for someone considering buying the combo new as this is as close to new as you can get.

Thanks,
Reed

Topic: 2390 Message: 2390

Hello, I have just bought a new FT-100 and I would like to know if anyone has the same problem that I have with the UHF sensitivity.

Here is what I have found It takes about 3.0 Micro Volts on UHF for 12 db sinad.
Compared to 2 meters, It takes about .20 Micro Volts for the same signal level at 145 MHZ.

I think I have a bad one, I dont think they would leave them with that kind of deaf front end.
If you guys could help me with your findings I would be thankfull

Thanks

When is Jeff Lynn and Yeasu going to come clean and ADMIT that the FT-100 is a big Little DUD!!! They haven't got a clue as to where to start and try and fix all the problems with the radio. As far as I'm concerned its the WORST radio I ever had x2! They should re-call the whole lot and give us our money back. A used FT-100 is worth-less and nobody wants to give you anything for it because EVERYBODY knows its a LEMON! Look at the used gear on the web and I'm sure you'll agree... even new 100's dropped to under $1700.00 cdn. at x-mas time. Yeasu is using the ham community as there testing and Q.C. grounds, shame on Yeasu!

One pissed very pissed ham!

2393. ATAS-100 mounting suggestions?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-01-10 04:47:29 UTC
From: piperbill@jps.net
Topic: 2393 Message: 2393

I have an older (1988) BMW sedan and I'd like to mount the ATAS-100 somewhere on it without drilling holes. I checked out the Diamond K400 mount but the dealer said he really doubted it would be sturdy enough in the long run. Also, the lip of the mount doesn't appear to be able to fit in the relatively narrow space between trunk and body.

I thought about punching a hole in the rear bumper, but that leaves it a bit more vulnerable to damage from another vehicle (even a slight bump), and it would also put the coil just barely above trunk level.

Even if I wanted to cave in and punch a hole in one of the fenders, each one is pretty narrow because BMW gave a lot of space to the front and rear lids.

I've seen some pretty good truck installations (in fact, I guess I could just break down and install it in my 85 Ranger) but I really want to see if I can get this auto installation.

Any thoughts? Thanks!

Bill, WK6A

Rob,
It is a shame that you are having problems, almost everybody has a problem of some sort in life. Not everyone is having a problem with the radio. I have seen people that have had problems just from not adjusting the menu's correctly, and other just from bad installs, and others with legitimate complaints. If you are hostile take it up with Yaesu not the whole bunch here. I enjoy your opinion, but on the other hand your heated opinion would come in better aimed at the proper people not at all of us. So try taking it up with Yaesu and leave the heat turned off, when it comes to those of us that love the radio.

Gee, Rob... what're you trying to say? ;-)

Actually, I really don't get your intent. You're obviously ticked off at something but something doesn't make sense. The FT-100 is the newest of the three major brands, so of course it has the fewest 'for sale' ads. I see plenty of TS-50 and IC-706 ads, but rarely see one for the FT-100. With time, that should equalize. Or, if you're saying that there are LOTS of FT-100s on the 'for sale' lists, please point me to them... I was looking for weeks to find more than one used one. And that one was barely used; the owner just didn't have time.

I have a ball with my FT-100 as do the vast majority of owners. Great little rig, and easy and fun to operate.

Your comment about Yaesu "using the ham community" as a testing ground is kinda one-sided. ALL of the companies use hams as their testing ground. That's why they have so many 'updates' to all the rigs over the years. It's not the company engineers that find the problems and bugs... it's the user.

73,
Bill, WK6A

"When is Jeff Lynn and Yeasu going to come clean and ADMIT that the FT-100 is a big Little DUD!!! They haven't got a clue as to where to start and try and fix all the problems with the radio. As far as I'm concerned its the WORST radio I ever had x2! They should re-call the whole lot and give us our money back. A used FT-100 is worth-less and nobody wants to give you anything for it because EVERYBODY knows its a LEMON! Look at the used gear on the web and I'm sure you'll agree... even new 100's dropped to under $1700.00 cdn. at x-mas time. Yeasu is using the ham community as there testing and Q.C. grounds, shame on Yeasu!

One pissed very pissed ham!"

Rob You obviously never owned a Kenwood TS440. That must be the worst radio ever built. It had over 100 pages of fixes on one web page I found. (these are fixes not mods) Most of what you see on a page like this is from the 1% with problems while the 99% are silent. I have seen that on several other users groups and it makes the product look bad when it is not. There are lemons in everything and it appears that you got one but that does not make all of them bad. Roger Gray, N5QS > "When is Jeff Lynn and Yeasu going to come clean and ADMIT that the FT-100 > is a big Little DUD!!! Sorry if I'm getting carried away, it's not towards anyone here on the page. I'm just looking for answers as to why Yeasu's FT-100 is having so many problems and why Yeasu is lying to so many people about it's performance. I can honestly say I've had over 20 years exp. in radio and 10 or so big rigs not incl. handhelds (10) and mobile vhf/uhf stuff (7) in my life. Everyone in Winnipeg that has had an FT-100 has returned it for one thing or another... some like myself more than once and with 2 different radio's! The two that I had both burnt up in less than 3 mins. out of the box! Same with another guy I know who went through 3 in a week. And how come HRO, Burgharts, Radio world etc... all tell of big #'s coming back or being sent to Yeasu USA for repairs. And also what's up with this Jeff Lynn who tells everybody that he has only seen a few back for repair and " What problems, there's no problems with the radio that I'm a where of ". He personally told me when I called him to complain, not to mention anything about my experiences with the radio. Too many people are having problems with everything under the sun with this radio and Yeasu won't admit it... come-on something's not making sense here. I have never had this many problems with a radio before, nevermind read about it in the news groups like its the lemon of the year. There's problems with everything not just minor things. Myself and others don't like spending $3400.00 cdn. on a loaded radio to have to send it in for repair multiple times back to the US! It's a pain in the butt not to mention an insult to my intelligence that Yeasu tells me there's nothing wrong and to not say anything about the radio's performance to others. I'm warning people and telling other's what happened to me that's all, nothing else. I'm happy to hear other's are having good luck with there's but that's the exception, not the norm from what I can see. And by the way I did talk to Yeasu head brass and told them of my concerns about 4 months ago with a promise of a call back... phones not ringing!

Rob,
It is a shame that you are having problems, almost everybody has a problem of some sort in life. Not everyone is having a problem with the radio. I have seen people that have had problems just from not adjusting the menu's correctly, and other just from bad installs, and others with legitimate complaints. If you are hostile take it up with Yaesu not the whole bunch here. I enjoy your opinion, but on the other hand your heated opinion would come in better aimed at the proper people not at all of us. So try taking it up with Yaesu and leave the heat turned off, when it comes to those of us that love the radio.

I can really understand your frustration, Rob, considering what you've gone through. I suspect I'd be similarly inclined to be upset at Yaesu, given the same situation.

I'm really interested in more detail about the 'high return rate' that dealers are telling you and your friends about. I saw some comments like this in the archives and I made a special effort to ask questions of several national (U.S.) dealers about the FT-100 problems. While a couple agreed that they had returns in the first few months, none of them said they've had any significant numbers of problems in the past several months. By significant, they said that there is no appreciable difference between the Yaesu, Icom, and Kenwood.

I can't say as I've had any dealings with Yaesu (this is my first Yaesu HF rig), however it does sound like many dealers are being inconsistent in their stories.

Are you guys up North getting the same radios, or does Canada require a slightly different model for compliance reasons? This isn't a facetious question... I really don't know. There are at least a couple different versions of the FT-100 being manufactured.

Bill

Bill,

Good question... I can't answer that one either about the version of radio we get up here. But I can say that HRO, Burgharts and Radio World in Toronto all said to me that they were getting alot of returns for warranty... mind you this was about 4 month's ago. Anyway lets just say I had the worst experience in my hamming life with the radio and it still stings. I'm glad you atleast got a good one and didn't have to go through what I had to. And as far as I'm concerned Yeasu owe's me a phone call!

I have to agree with you Terry, both myself and a friend have had the same problems trying to get AM to work properly. We have tried in vehicle and out, grounded the heck out of it, plenty of current, all the settings. no luck. I would also be glad to hear a solution. Guys: Unless you have some problem with your radios that I haven't seen, the AM mode should work fine. You do need to run about 25w and bring the mic level down a bit. The other thing to keep in mind is that you may not be able to give each other true reports of the signal quality unless you are some distance apart. That's because the front end needs to remain linear when listening to AM and too much signal will cause problems. Also check to see if you have the noise blanker off, which may not like strong AM signals. Chuck On Mon, 10 Jan 2000, Andrew C. Wells wrote: > From: "Andrew C. Hi Folks,
Just a quick word on this SWR Icon issue. I am not at all discouraged over this SWR issue with the radio. In fact having owned several Yaesu radios in the past, I am a true supporter of the product. My FT100, when it works correctly, is one amazing little package. I am just blown away with the performance. I would just like it to perform 100% of the time. The SWR icon issue is a pain in the butt. My SWR is less than 1.3 to 1 on all bands and the ground is perfect. When I can take the radio to the bench and perform a true 50 ohm dummy load test, and the Icon apperars then, I become a little concerned when it returns NTF. Some FT100's definately have an RF deck problem. My intelligence has been insulted by Yaesu. After 40 years of RF experience, 30 of them commercially, I have the ability to detect a problem. There may be a simple cure, but I haven't found it using toroids, matching devices, etc. I am sure they will find a fix sometime, but now if you have the bug, and you find!
a fix, be sure and let us all know including Yaesu. For now a simple "We know there's a problem we're working on it." would be more comforting than "Well, that's interesting, we can't seem to duplicae it here.".

Dan, W1PO

Now, THAT's an intriguing idea. There IS a tow hook, so I'll take a look. Wouldn't this put the antenna down pretty low and thus minimize effectiveness since the coil and lower half will be right up against the trunk body? Also, it's occurring to me that there is a potential for backing into something (or something hitting ME) and damaging the antenna. Or am I not reading something correctly? Suggest you check out the COMET CQ5M trunk lid mount. It works very well on my 98 Audi A6quattro. The trunk lid clearances were even less than on my Lexus. It is a quick disconnect mount and makes for hiding the ATAS a 5 second job. Bill Tubbs wrote: > > From: "Bill Tubbs" > > Now, THAT's an intriguing idea. There IS a tow hook, so I'll take a look. From: Charles Cabral
Topic: 2408 Message: 2408

Bill WK6A,
you should not go by your dealers say so, what does he know about this stuff, is he a "ham"? I have 4 K400's and 2 K600's on my Van and I never had a problem with them breaking up, letting go or whatever. just got make sure you install it right, don't forget to scrape the paint under the lip for the best screw contact (ground). I even had a screwdriver antenna on one of the K400's, (over a month) until I had the proper mount for it installed, and it held like a charm! So go ahead and install one, don't go by what your dealer has to say! My 2 cents worth.

Hi Rob,

I have had my FT-100 in the truck sense last May and have had a great time with it. I had some of the SWR problems for a bit, but found my ground strap to the antenna base had come loose. I corrected that and it worked fine.

I don't see how Yeasu can be held responsible for a bad installation.

Have others who have had the high SWR problem used a dummy load at the radio and then the base of the antenna to eliminate the antenna system?

Good point Roger. For a time there was a fellow here who was keeping poll going of the members of this list. He would update it as folks sent him information and it had a list of the number of FT100s on the list and the number of those with any problems. There seemed to be a few bad ones the first month or so but not nearly as many as some folks would have you believe.

It might be nice if we took another such poll. Any volunteers?

From: Jeff Uchitjil
Topic: 2386 Message: 2411

Yeasu had a problem with this in the early radios. Mine can from Dayton and had the problem. They told me there was a fix and to send it in. I waited a while as I don't do much AM work. The HF output went to nothing a few weeks later. I called Yeasu again and they told me this was also a problem with the way some of the early models finals were biased. This made sense to me, and I do a lot of work on radios myself. As it was under warranty I sent it off to them 2nd day air. They received it fixed both problems and updated to current specs. I received the unit back 5 days later via 2nd day air and all has been fine since. The AM modulation works great when carrier is below 25 watts, mic gain to 35 and processor on. I love the radio and I have run a 706 MKII to compare it to. As far as I'm concerned it runs circles around the ICOM overall. (The CW paddle feature built into the mic up down buttons of the ICOM would be nice to have.) The DSP makes this radio a real treat to run mobile, especially on CW where mine spends a lot of time. Kenwood is so far behind with the TS-50/60 combo its not worth the compare. 2412. Reverse CW option

Yahoo group: FT100 (1998 — 2000)
Date: 2000-01-10 22:50:43 UTC
From: Timothy H. Heaton
Topic: 2412 Message: 2412

I've had my FT-100 for three weeks now and am absolutely loving it. It does so much more than any radio I've ever had before. The first thing I noticed compared to my old rig was the noise floor. When I disconnect the antenna from the FT-100, it actually goes quiet! :-) I'm just beginning to learn the miracles of DSP and am impressed with how well certain types of QRM and QRN can be almost completely eliminated. Wow, what a machine. How could anyone call this model a dud?

One thing has puzzled me. I've tried using the reverse CW option to copy a weak signal next to a strong one as the manual explains, but when I switch between CW and RCW I loose track of the received signal and have to hunt it down again with the VFO. I understand the VFO/BFO offset and how you need to tune to a different frequency for CW & RCW, but it seems like the radio should be able to track this difference so that a station that is right on the target frequency (zero-beated with the side tone) would sound the same in CW or RCW mode.

Have any of you used the CW/RCW feature and found a way to track a signal back and forth?

-Tim (WB7NMY)

Sounds like you are having fun with your new FT-100!
Would you be willing to do a satellite QSO with me?
We could work each other on RS-13 which has a 10 meter downlink
and uplink on 15m and 2m.

I have not worked Clay county on satellite yet. Do you get into EN03, EN22,
and/or EN23? The intersection of the two IA grid squares looks like it is
1 1/2 hours away from you. There are 7 SD grids I have not worked yet on a
satellite. Texas is the only other state that I have that many left to work.

Let me know if you are willing to give it a try with your new FT-100!

You can see my QSL/Grid square status at:

http://www.xmission.com/~kohlwey/

73, Randy N7SFI

I am leaving for Vandenberg Air Force Base this Wednesday to watch the
launch of JAWSAT. Have you heard about all the new Ham satellites that
are going to be on that launch. I did the communications hardware for
WSU JAWSAT satellite as well as the ground station software.

Suggest you check out the COMET CQ5M trunk lid mount. It works very well
on my 98 Audi A6quattro. The trunk lid clearances were even less than on
my Lexus. It is a quick disconnect mount and makes for hiding the ATAS a
5 second job.

On the passenger's side, about midway between the window and the slope of the lid. It works great. No extra grounding besides the four allen set screws. I sure agree with THAT, Charles. The dealer is actually one of the HRO guys, and it wasn't WHAT he said but how he said it. Kinda instantaneous without even asking questions about the vehicle, location, etc. Too many guys on here have had success with that K400 to make it a bad setup. I AM curious about that Comet, however. It's much cheaper than the Diamond, but I don't know if it's as sturdy.

I have the FP-2300 power supply on the way so I can play with the rig in the house, and also bought the separation kit for when I finally get the FT-100 installed. I'm afraid I'll spend too much on gasoline once I get the thing in the car. I'm also kinda lazy and I can see where I might be tempted to just leave the rig in the car rather than mess with the pigtails each time.

My FT-100 and ATAS-100 combo recently started giving me the "high swr icon"
on 6,10 and 12 meters. I installed 2 "clamp on" ferrites on the coax by the
radio and no more problems. Sounds like a grounding problem with RF on the coax,
but nothing has changed on my grounding. Still checking this out.
A "RF Choke kit" is well worth trying for those with this problem.

Then you are asking that the radio actually switch the frequency of the LO
when you press the button. The displayed frequncy would have to jump up
or down 700~800 hz.

I suppose that would not be a big deal, but the industry standard is that
main frequncy doesn't shift, just the BFO - like it does on USB/LSB.

While you are complaining there, pass me yours for a great price if you
hate it so much. I work many countries with excellent reports and overlook
the radios minor shortcomings.. You cant ask too much from a radio that fits
in the palm of your hand and has the ability to do all bands and modes to
boot! I often work countries on the first try using the ATAS 100, the radio
has a fantastic rx and tx, superior DSP that other makes should "reverse
engineer" into their gear.. The FT100 kicks ass and fits in a zip drive case.
Its a 1000 dollar radio and Yaesu is continually updating and making good on
all warranty repairs while Kenwood doesnt even want to know your name. Heck,
you cant even get parts directly from them, you have to deal with uscrupulous
middle men to buy your parts... Like I said, if you dont want yours, I will
give you the "bottom barrel" price for it since they are so "shitty" and
start working the bands from another vehicle.. As far as I am concerned,You
can never have too many FT100's... Richy KB2CPW

Bill.

I will agree with everything you said about the f100 purchased here in Canada. I was one of those in Canada that bought them when they first arrived (within the first few months)

Here is the dirt (and excuse me, I won't mention names)

Myself.. bought radio and ATAS-100. ATAS 100 was replaced in first 2 weeks of ownership. FT-100 Went back for repair 3 times to local dealer, before they gave up and sent the radio to cerittos.

Ham #1. Radio sent in for repair 4 times, before local store gave up and sent it to cerittos. Cerittos replaced the radio. Oh yea, His ATAS 100 has also been sent in for repair at least twice

Ham #2. Radio has been in for repair 3 times

Ham #3. Radio has also been sent in for repair several times (at least 3) .. Currently, I think it is in cerrittos.

The joke of it all is we are all friends on a local repeater in this area. If it weren't such a sad situation, it would be hysterical. We have all actually become rather fatalistic about the whole thing. We have running contests when someone gets their radio back on how long the thing will last THIS TIME before it dies. We are awestruck when two of us hams actually have a conversation on the repeater, and we both have working radios. Heck, when Ham #1's radio failed, it actually filled his car full of smoke. We jokingly wonder when Yaesu will be supplying halon fire extingishers with the FT100. (-: When he first sent it in for repair, their comment was that it must have been struck my lightning, it was burnt up so bad.

We gang up on the yaesu rep when he comes up here for special "Yaesu" days. We consider it sporting.

So yea, I wouldn't recommend this radio to my worst enemy.. (or maybe I would (-:)

Rich

Hi Randy,

I installed a FT100/ATAS100 in my Durango a few weeks ago and really like the radio. After I read your message, I listened for RS13 and was able to hear it using the FT100/ATAS100 much better than I could with my FT847/G5RV. I think the G5RV has a lot of lobes and nulls on 10M so that isn't good for a satellite downlink.

I don't know how I'd begin to adjust for Doppler with the FT100 on the 2M uplink though, since it is not a full duplex radio. It will work in split band mode and if you can figure out a way to stay on frequency, you could probably make an RS13 satellite contact with it. But I feel it would be much easier to make satellite contacts with the FM birds such as AO27/SO35 than on RS13. I may give that a try here soon.

I have also been able to work JA's much more successfully on the FT100/ATAS than with my base rig on the G5RV. I've also gone out to the car during QSOs to get signal reports and they always come back as being equivalent to the FT847/G5RV so I am very pleased with its performance on the 10,12,15, 17 and 20M bands. I haven't done too much on 40 meters yet.

Hi there Richard. Very odd. I'm in Canada as well. I bought mine from the U.S. and had it shipped here. It's been terrific, with no problems other than the occasional operator error right from day one.
Given that there are so many that are fine, it would appear that rather than a bad overall design, the problem is more one of quality control, or a particular shift on the assembly line, or some such thing.
I really hope things improve for you and your friends. I know I was overjoyed with my new toy, and would have been heartbroken to have the same problems that you and your friends have had.
William

2431. DTMF pad on the MH-36B6JS Microphone

Yahoo group: FT100 (1998 — 2000)
Date: 2000-01-13 04:10:51 UTC
From: blcooper@xxxxx.xxx
Topic: 2431 Message: 2431

Not that it's really that important, but is it possible to hear the tones when the numbers are pressed on the DTMF pad? When I used it to access the phone patch on a local repeater, it worked fine, but for some reason it kind of bothered me that I couln't hear the tones. Is there any setting on the radio that can be changed to allow me to hear the tones, or is this just the way the radio's set up?

By the way, I've had my FT-100 for about 2 weeks, and so far I love it. I haven't really had a chance to use the ATAS-100 yet for mobile or in a base station set up, but I don't expect any problems. Have very many problems come up with the ATAS-100? Maybe I can get some feedback from some experienced FT-100/ATAS-100 users. Thanks in advance.

2432. Need some help with ATAS100 New Antenna not working

Hello
I hope someone can help me.After some thinking I decided to purchase the FT100 and the ATAS 100 Antenna. I had the radio and antenna installed over the weekend by a professional two way radio shop. Installer is also a ham.This rig is in a Ford Expedition with the antenna mounted on the bumper. Nice neat installation. The first hour the radio and antenna were working fine. After that the antenna does not want to tune anymore. It seems to tune sometime on 40 meters but the high swr icon keeps coming up. When I brought it back to the radio shop we tried again and the boot of the antenna went up when it was supposed to go down and down when it was supposed to go up sometimes. The long and short of my question is I purposely ordered this antenna for the low profile no drilling holes etc look. Are we doing something wrong.Are there some adjustments that we can make or does it sound like I have a bad antenna. I was wondering if anyone has any suggestions if this antenna does not work out what I should go with for the ft100. I am fairly new to the hobby so any suggestions would be greatly appreciated. Did anyone else have the same problems in reference to the antenna not wanting to tune and why does it only tune when it does on 40 meters
Many thanks
Mark

The antenna logic is trying to return to the starting positon, I believe. Also, a ferrite donut with about 3 or 4 turns of coax under the antenna will help reduce the dredded "high swr" icon. See page 66 for the re-tune procedure....Dale KC2PZ

2434. Working RS13 with the FT100

Yahoo group: FT100 (1998 — 2000)

I had a successful satellite contact from my car using the FT100 on RS13 today. RS13 is a challenge to work half duplex, but if you can keep track of the time of the pass, you can estimate the Doppler shift required and call CQ and find your downlink by listening for a reply. (I'd like to thank to Chuck, KI0AG, for this tip.) I also found that while working split, you can continously adjust the uplink frequency for Doppler while holding down on the PTT which is probably a good thing to do so that you're not wildly off frequency when you stop transmitting. I was using a mag mount whip for the uplink and the ATAS100 for the downlink. (I was parked at the time and DO NOT recommend working the birds while driving along!)

I also worked a guy yesterday on AO27 who was using an FT100 and a 3-element handi-tenna (http://members.aol.com/k5oejerry/handi-tenna.htm)
for the downlink and another rig with a whip for the uplink. I think that with an Arrow Antenna if you make sure to adjust the power so as not to overload the duplexer, the FT100 makes a very capable FM satellite rig and something you can use on RS13 in a pinch.

Yet another use for this amazing radio...

Yes I have seen this before. I think you have an intermittent ground or you have started the vehicle with the radio turned on. To cure the problem make a note of your microphone settings and such. Turn the ATAS 100 off in the menus, (61) I think. then preform a master reset of the FT100... You might have to do this twice. As soon as you turn the ATAS antennae back on it should go down and work properly afterward. And don't start the car with the radio turned on, it's a good way to make the radio unhappy with you... Allen kb5gme I learned this through my personal experience... I expected to loose memories when I reset but they were not erased... :) Mic settings were though.... 2436. 2 Week Old FT-100 & An ATAS 100 For Sale

Yahoo group: FT100 (1998 — 2000)
Date: 2000-01-14 01:46:05 UTC
From: Joe Mattern
Topic: 2436 Message: 2436

Group,

I have decided to sell my 2 week old FT-100, YSK 100 remote mounting kit. and 9 month old ATAS 100 antenna.

The FT-100 is in near mint condition. Please note that the wiring harness has been cut in length to fit my particular application.

Everything is complete in the manufacturer's boxes and is in proper working order per Yaesu specifications.

Price: $1250 plus insured shipping costs.

If interested, please feel free to email me at WW4WJD@...

Thank You,

Joe Mattern
Orlando, Florida

2437. working perfectly

Hi All,
I haven?t entered much in to the discussion in the past because
I haven?t had my FT-100 very long. I obtained my FT-100 in December
and have it in my truck (see NissanInstallation in files). I haven?t
had the opportunity to try out all the bells on the rig yet, but have
used several. The long and short of it is that I find everything on
mine working perfectly, after I understand what the manual is trying
to tell me. I haven?t done AM mode yet, but have worked most of the
bands, 40M, 20M, 10M, 2M & 440. I have looked at all the advice and known
?bugs?, like low power on AM, toroid at the base of the ATAS-100, etc.
My experience with the radio is that it has performed up to at least
99% of my expectations.

Has anyone figured out how to operate on 160M or 80M with the
ATAS-100 ?

Chris

>Mark >>

All in all the firmware that controls the antenna needs sometweaking by
the Yaesu crew. The radio is somewhat blind to what the antenna is doing in
that it has no idea where it is and bases the control voltages on the last
known swr match and tunes from there based on direction of frequency . The
antenna can lose sight of where the last match was which results in the
antenna tuning in the opposite direction than intended. A match can be forced
by making the antenna tune manually using the PPT up/down feature but this
may or may not relock the antenna into the auto mode. When this happens, and
I am not using the rig for any qso's I simply allow the antenna to do its
thing on an open freq and let it recapture the auto match settings then it
will tune fine when changing bands.
As far as the ATAS is concerned, the antenna demands excellent RF
grounding. You must have the radio grounded, good battery connections, keep
it up high and away from any resonant parts of the vehicle. Mine sometimes
transfers RF to the heater grids in the rear window, I can tell because the
defrost button lights up like a Christmas tree (great as a modulation
indicator :-) and I know that my audio will sometimes distort, this is a
problem with the car as there is no better place for the antenna. My trick is
to tune the antenna for a low swr in auto, then manually tune for 2 bars
which decouples the antenna from the grid then everything is fine.
I followed everyones recommendation and added a ferrite core to the coax
with 5 turns thru it and a small one on the mic line. I suggest you do this
as it is the best countermeasure to the rf problem some FT100's encounter..
Hope to hear you on 10m!! Regards.. Richy

2439. TUN signal from FT100

Yahoo group: FT100 (1998 — 2000)
Date: 2000-01-16 22:18:37 UTC
From: mikef
Topic: 2439 Message: 2439

Does anyone know what kind of signal the "TUN" function provides to the ATAS100 from the FT100?

I would like to try to make use of this signal from the FT100 to remote tune the LDG AT11 tuner.

Possibilities:
DC signal level?
Audio tone?

DC signal would be easy to extract from the coax at the remote location. Audio would be a bit tougher.

Any ideas?

Mikef

Mike....seems like someone posted a note to one of the news groups that said the ATAS100 uses 9 VDC for one direction and 12 VDC for the other direction. The trick is knowing which way to go! The logic in the FT100 remembers which direction it should go based on where you were tuned and what Freq. you want to tune to. Dale KC2PZ

Hello All,
I just purchased a brand new FT-100 two days ago. I have serial number
9D021456 and immediately noticed the following problems:

1. Intermittant SWR / Power shut down in the 440 band. Antenna OK
2. S- Meter not linear S0 - @ S5 OK anything above this doesnt exist regardless
of how strong the sig is
3. Receiver audio power way too low.. Need a speaker preamp just to hear
4. Occasional " power outage upon transmit " radio and lights flicker out intermittantly
5. Standard Memories above 3 do not exist !!! Where are the other 296 ???

The problem can be either, i have a older radio that needs to be " upgraded at
the factory " or I have a poorly designed radio. I would prefer to have the
radio fixed and keep it I have read alot of the archives on this radio as well and have not
found a
concrete solution for the problems. can anyone shine some light of this ?
Do I need to exchange the radio for a newer one or send this back to the factory
for upgrade ???

Jeff K7XQ

Try a dummy load at the FT-100 to verify this. Don't trust your antenna
or feedline.

> 2. S- Meter not linear S0 - @ S5 OK anything above this doesnt exist regardless
> of how strong the sig is

S Meters are logarithmic, not linear. The FT-100 S meter is the most
"true" I've ever seen! But Mine can get up to S9. Takes a REALLY
powerful sig to go over S9 - as it should!

> 3. Receiver audio power way too low.. Need a speaker preamp just to hear

Can't comment on that. Never heard this complaint. How's your muffler?

> 4. Occasional " power outage upon transmit " radio and lights flicker out intermittantly

Make sure the radio has a solid GROUND connection at the rig and at the
antenna. You can not use a mag mount without begging troubles.

> 5. Standard Memories above 3 do not exist !!! Where are the other 296 ???

Read manual. Sounds like you are in the Quick Memory mode. I don't think
you have a old radio (I have one of the first FT-100s in the US) I think
you have a "new" radio and it takes a while to get used to it. It really
does a lot. Mine went back to Yaesu twice. I have the ATAS100 also.

Good Luck!

Hi, all. Considering the purchase of an ATAS 100 to accompany the FT100. The vehicle is a 1999 Dodge Caravan. I have no trailer hitch and don't wanna drill holes in the van body. Suggestions for mounting the antenna - and, if appropriate, methods to avoid - would be appreciated. Ideally, I'd prefer a method that allows easy removal for garage parking of the van.

Hey, Brad, I have my ATAS 100 mounted in the upper left hand corner of the rear door, standing behind the van looking at its rear, of my Chrysler Town and Country minivan, very much like yours, using a Diamond K400 mount, modified to attach to the door jamb rather than the door. It works there beautifully. I tried another antenna mounted on the trailer hitch, and most of my contacts were "I can just hear you in there." Now I get excellent signal reports, and seldom a difficulty on being heard on the first try. That would be my recommendation. If you just bought this radio and it is a 9D serial number, I'd take it back as quickly as possible and request another. That unit is one of the earlier units. I know of several purchased at Dayton back in May, and they were 9E's at that time. The last I remember seeing, a 9H lot unit was shipped.

I'd want the latest unit, especially with the track record of the FT100. Another model radio, I may not be as concerned!

Hello All,
I just purchased a brand new FT-100 two days ago. I have serial number 9D021456 and immediately noticed the following problems:

1. Intermittant SWR / Power shut down in the 440 band. Antenna OK
2. S- Meter not linear S0 - @ S5 OK anything above this doesnt exist regardless
of how strong the sig is
3. Receiver audio power way too low.. Need a speaker preamp just to hear
4. Occasional " power outage upon transmit " radio and lights flicker out intermittantly
5. Standard Memories above 3 do not exist !!! Where are the other 296 ???

The problem can be either, i have a older radio that needs to be " upgraded at
the factory " or I have a poorly designed radio. I would prefer to have the radio fixed and keep it I have read alot of the archives on this radio as well and have not found a
concrete solution for the problems. can anyone shine some light of this ?
Do I need to exchange the radio for a newer one or send this back to the factory
for upgrade ???

To be more specific on my problems:

1. Intermittant SWR / RF Power Shut down on 432 MHz Band.... Happened on three antennas with better than 1.5:1 SWR. One mobile and two M2 Beams

2. S- Meter. Comparing to other radios: S0 - S5 comparable to two other radios about the same. S10 - S60 on most radios only give me about S5 - S7 on this radio.

3. Audio too Low. I beleive the problem is low RX IF Gain. The weak signals are heard OK but the RX IF Gain appears to be too low. Also have to crank the volume maxed out especially on SSB. FM is very marginal.

4. Memories suddenly are working OK now. Dont know what i was doing differently. before.

5. I read that alot of people sent their radio back and most of the problems (like the intermittant SWR and Audio power issues) are fixed. This makes me beleive that there is a " upgraded " but have not confirmed this.

Brad and Chris: I hope you find this mounting useful as I did. The modification to the mount is not necessarily intuitive, so when you get it, let me know, and I'll tell you about the modification. It was provided to me and others on this list some time ago, and I'll either dig that out, or explain it again. But it will help you to have the mount in front of you. Also, Brad mentioned ease of removal. Mounting it that high on the vehicle definitely gives best performance, but it does require removal if you park in a garage. I simply unscrew the antenna from its mount and put it in the garage when I get to the house. I put it back on when I take a trip that's long enough to consider HF. I have a separate antenna for 2 mtrs and 440 that stays on all the time, and I use it for shorter trips. Good luck! Jeff:
Was the S-Meter discrepancy on FM? If that's the case, you can expect
that. Many radios that do FM don't do a real S-Meter reading but
actually use limiting. It seems the FT-100 displays real signal strength
when in FM, so in comparison to many other FM tranceivers you won't see
anywhere near the same signal levels over S-9. Keep in mind that 60 is
60db over an S-9 signal. Do you really expect many signals to be that
strong?

I had this problem with my FT-100. I sent it in for warrantee work. They
returned it to me having replaced a diode. It worked for about 4 weeks
before the symptom came back again. I sent it back for more warrantee work
again. I got it back today and haven't installed it yet.

The packing slip says "Replaced all defective parts as shown:"

Diode DAP236U T106
Transistor BA1A4P
Carbon film res RD16TPJ101
Chip res RMC1/16 182JATP
Chip res RMC1/16 220JATP
Chip res RMC1/16 470JATP
Carbon film res RD16TPJ470

I'd send it in for warrantee work if I were you.

Well, The Canadian FT100 woes continue.

Forgot to mention.. Ham#1's replacement radio came back from cerittos. It packed it in in 2 weeks. Local store fixed it. It just packed it in again yesterday.

Ham #3 got his radio repaired back from cerittos (turn around time without radio was 5 weeks. Must be shipping via pony express). We were all ready on the repeater to start our "how long will it last this time game". We never got the chance. It lasted TWO HOURS.

We're just ready to take all radios back and demand a cash refund for all radios and antennas (since the antenna was bought for this radio). This has gone past silly, straight to insane.

Advice ?

Richard

Subject: RE: One-percenters

Bill.

I will agree with everything you said about the f100 purchased here in Canada. I was one of those in Canada that bought them when they first arrived (within the first few months)

Here is the dirt (and excuse me, I won't mention names)

Myself.. bought radio and ATAS-100. ATAS 100 was replaced in first 2 weeks of ownership. FT-100 Went back for repair 3 times to local dealer, before they gave up and sent the radio to cerittos.

Ham #1. Radio sent in for repair 4 times, before local store gave up and sent it to cerittos. Cerittos replaced the radio. Oh yea, His ATAS 100 has also been sent in for repair at least twice

Ham #2. Radio has been in for repair 3 times

Ham #3. Radio has also been sent in for repair several times (at least 3) .. Currently, I think it is in cerrittos.

The joke of it all is we are all friends on a local repeater in this area. If it weren't such a sad situation, it would be hysterical. We have all actually become rather fatalistic about the whole thing. We

have running contests when someone gets their radio back on how long the thing will last THIS TIME before it dies. We are awestruck when two of us hams actually have a conversation on the repeater, and we both have working radios. Heck, when Ham #1's radio failed, it actually filled his car full of smoke. We jokingly wonder when Yaesu will be supplying halon fire extingishers with the FT100. (-: When he first sent it in for repair, their comment was that it must have been struck my lightning, it was burnt up so bad.

We gang up on the yaesu rep when he comes up here for special "Yaesu" days. We consider it sporting.

So yea, I wouldn't recommend this radio to my worst enemy.. (or maybe I would (-:)

Rich

I picked up my FT100/ATAS last April(its a "D" serial #) from the dealer in Calgary. Nine months later(and several trips overseas) it still works flawlessly! No problems at all. I know several local hams who have the FT100s and have no problems. Heck, my ATAS still works in -25C!

I would be interested in knowing the real failure rate for this model as compared to say the FT1000...

2469. transmit on the 220 MHz

Yahoo group: FT100 (1998 — 2000)
Date: 2000-01-21 23:19:50 UTC
From: cnelsen@kconline.com
Topic: 2469 Message: 2469

Has anyone figured out how to get the FT-100 to transmit on the 220 MHz band ?
I have done the frequency mod and it has opened up several "out of band"
frequencies, I was hoping it would open up the 220 also. Or maybe I haven't
figured out proper sequence yet.

Thanks
Chris

Nope, I haven't done it, but FYI the finals should be capable of appx 100-125 watts on the 220 band. This is the result of the same set of broadbanded finals which are used for both 2m and 70cm. I haven't even done any listening on 220 to see what the receiver is like...to be honest, I don't even know if you CAN tune 220.

How can the FT-100 be capable of 100-125 watts on 220 when it only handles
100 watts on HF, 50 watts on 2 meters, and 20 watts on 440? :-)

If making the radio capable on 200 was a simple matter, no doubt Yaesu
would have thought of that (it being a significant selling point).

The rig seems to receive find on that part of the spectrum, though in my
area there isn't any 200 traffic to actually test the sensitivity, etc.

2472. FT100 Modification

Yahoo group: FT100 (1998 — 2000)
Date: 2000-01-22 14:06:39 UTC
From: rickkoch@bit-net.com
Topic: 2472 Message: 2472

I tried the modification as shown in the Files section here,
but it doesn't seem to work. My rig didn't have 6035 installed
but did have the other 3. I removed 6036, reassembled, and followed
the powerup procedure with the DOWN/STEP keys. I never saw any
R on or HF on display anytime through the sequence. After the
sequence was finished I still could not transmit on any non-ham
frequencies.

Has anyone else tried this mod on a 9HXXXX serial or higher??

Rick/N1GP

2473. ATAS 100 Ant

Yahoo group: FT100 (1998 — 2000)
Date: 2000-01-22 15:23:51 UTC
From: k5mog@arrl.net
Topic: 2473 Message: 2473

Hello
Is there anyone out there who can explain how rf is coupled to the antenna.
Since the center conductor appears to be terminated in the motor control circuit
with the antenna grounded to the vechile instead of above ground and connected
to the center conductor. Is there a torroid or capacitor coupling in the base?
I would like to use the motor control with other srewdriver type antennas, but
this has me stumped. I,m already deep into this project and have copied the control
circuit and modified to handle more current, but istalling in my bandhopper
causes the swr to go out the window. My FT100 will try in vain to resonate the
antenna but the control circuit apparantly shorts the antenna to ground, Any comments
will be appreciated.

The FT-100 uses one set of finals for bothe the 2m and 70cm band. Take a look at how much current the rig draws at full power output on 2 or 70. Average draw is approximately 18-22 amps. That is WAY overkill for 50 or 20 watts output, hence its only operating at about 50% efficiency (compared to 'normal' 8-10 amps) on 2m and about 15% on 70cm. So, if you start doing the math, the approximate peak of efficiancy in the finals is in the 220 band.

Actually, if the radio was capable on 220 it is an anti-selling point except here in the US. In many countries of the world, japan included, the 220 band is a common police band. The manufacturers tend to be discouraged from building rigs capable on 220. I believe some countries even refuse their equivalent of type acceptance if the radio is capable. Hence, most 220 radio tend to be of 'ancient vintage' compared to most modern VHF/UHF transceivers.

I live in Southern California, and I understand there is some fairly significant 220 activity here; especially the Condor Network which is 220 linked machines from tip to tip of CA. I'll try to find the time to listen in the near future.

From: cnelsen@kconline.com
Topic: 2475 Message: 2475

OK, this dummy needs some help. For two days mow I have been working with the FT-100 trying to get frequencies into the first 10 memory channels. By some strange button combination I succeed at getting one, but don?t know how I did it. The when I try to get a second one entered, I end up writing over the first one. Anyone have a straight forward, plain English instructions ? The manual and me are not getting along very well !
Lets say I have a frequency in the display and want to put it in memory channel 1.
I press the VFO/MR button and get the memory ?icon?, but I am in the wrong memory group.
When I get to a point that I can change the memory group to where I want to be, I can?t enter the frequency into memory. Too dam many buttons that change functions with sequence of other buttons much less the ? sec. two function of several buttons !

Hi:
My name is John Hansen, W2FS. I wrote the article in the December QST on how to build a direct frequency entry keypad for the ICOM 706. I'd like to create a similar device for the Yaesu FT-100, since there does not seem to be any way to directly enter frequencies on the front panel of this radio either.

However, I don't own an FT-100. I'm wondering if anyone might be willing to scan the pages in the manual that are concerned with computer control of the radio and e-mail them to me? If this is not possible, could I talk someone into photocopying them and mailing them to me? I'd be happy to reimberse any costs.

In addition, I'll be looking for someone who might be willing to betatest the keypad when I get it built. Ideally, it would be best to find someone locally (in Western New York) but I've asked around here already and not been able to find anyone who owns an FT-100, so I may have to look elsewhere.

Thanks in advance for any assistance you can provide.

John W2FS

Thanks to everyone who has volunteered to photocopy or scan manual pages for me. I know have them and can go to work. I really appreciate the response. I've been trying to get hold of this stuff for a couple of weeks and I guess I just didn't ask the question in the right place. It appears, by the way, that the relevant computer codes are the same as for the FT-1000MP (and perhaps other radios) so that a keypad that works for one of these should work for the others too.

Thanks again,

John W2FS

From: John Hansen
Topic: 2482 Message: 2482

Does anyone know for sure whether the FT-100 uses RS-232 level signals or TTL level signals? Also does anyone know for sure whether the data line idles high or idles low?

If I had an FT-100 I'd try the following to find out. (I can't actually recommend you do this with out getting in trouble with my wife, the attorney). I would take a DC voltmeter and measure the voltage between the "data out" wire of the CAT socket and ground with the radio turned on. If it's the usual TTL level signal there that idles high (like on the FT-736), you would see +5 volts when the radio is turned on, but you aren't pushing any of the buttons or moving any of the dials. If you decide to do this, make sure that you don't short the data out line to ground as it could possibly damage something.

Anyway if anyone either knows the answer to this off hand or happens to conduct the above experiment, please send me the answer. I'm pretty sure that all of Yaesu's other new radios (like the FT847 and the FT1000MP) use RS-232 level signals now, but someone wrote to tell me there was something in the manual about the CAT cable containing a level converter (as if it were still using TTL level signals).

Any assistance would be appreciated.

73, John W2FS

Some of you remember some of the problems i had with my first unit last week.
HRO at Oakland has a full exchange policy within 10 days so I replaced the
unit with a " 9F" Ft-100. The SWR Icon / Power Shut Down on the 432 MHz
Band is non-existant on this radio. It is a real problem on a small percentage
of units and must be repaired at the factory. Although Yaesu woundnt elaborate
exactly what the problem was but I beleive it is a RF Detector problem associated
with the SWR Reverse circuit only on the 440 band detector. Possibly a wrong value
component or faulty transistor type.

The memory problem i had was Operator error on my part :(

The Low RX Audio in SSB in the 144/432 MHz band was improved for me by
increasing the RX IF Gain in the special alignment field..made a huge
difference but I am carefully watching for RX Overload..havent seen any yet.

The noise figure / sensitivity is very good on this unit. Made several rover contacts on
432
and 144 during the contest this weekend. Again..the RX If Gain made the
improvement here to bring the audio level up.

Will keep you all posted on my unit and my findings.

How do you do that? I have tried the BOOT ABC deal but it never seems to
work. My 2M SSB is almost dead quiet.

I have a friend in Buffalo who will be receiving an FT-100 soon. I believe
he would be willing to test it.... I sure would be interested in having this
device when you get it working! Keep in touch and good luck.

Marcus,

Sorry, but page 35 of the manual states that SSB is fixed at 10 kHz per step when using the select knob. (I also wanted to change the steps in SSB, to 5 kHz)

Chris KD4IBI

This is one thing that has driven me nuts for nearly a year now. I used to operate and FT-847 mobile and I was very spoiled by the 2.5KHz channelizing. That knob made it really simple to quickly tune around and not have to fiddle with getting onto a more 'normal' frequency. 10KHz is far too course of a change. 5 KHz would be better, but I'd sure like to see 2.5 or even 1.25 as options. I suppose an alternative is some type of software hack to reprogram a section of the firmware (I'm thinking of something like the FT-920 freeband mod in which you can use a computer via serial port to modify the firmware bandplan)

Some more info for those interested.
I am attempting to set up a Mobile Satellite System. Although the FT-100
does not do dual RX like the FT-847 ,I will use a seperate 2 MTR All Mode.

The Receive on the 432/435 MHz band is very sensitive. I was able to fully copy
a near complete FO-29 Pass in my car with just a Mobile Dual Band ICOM Vertical while
driving down
the road. Also about 30 - 60 % of several AO-27 Passes with the same arrangement.
(the limitation here is high elevation passes).I think this radio will cross
band using the split mode (havent checked for that yet). If so, this radio
will be fully usable on AO-27 except the ability to hear your downlink when transmitting.

There has been three or four inquiries about a mod for the
FT-100 to make it transmit on 220 MHz. OK you gurus, where do we
go from here ? Is there some kind of service manual that explains
the FT-100?s inner workings in such detail that some one with enough electronics and
programming back ground can his radio and himself
in a lot of trouble ? How do YOU people come up with these mods ?
Who and how do we encourage to take on this quest ? Give me a hint
where to start.
I have made the one mod that opens up the transmit frequencies
and have NO IDEA where those number and key combinations come from.
Just think of all those mutations of buttons, knobs and frequencies
to enter. Nobody just ?stumbled? on to it. Who has the inside line
on this stuff ?
I would like to get this radio to transmit on 220 MHz band.
I really enjoy this radio while mobile. Lets see if I could only get
it up and running on 160 & 80 meters along with the 220 band???
(give a guy an inch and he wants a mile).

Thanks,
Chris

Good questions, Chris. You need to remember, though, that behind the programming magic, the FT-100 has limitations on its capabilities. For example, even though you can open up transmit function outside the ham bands, the output power often drops off precepitously. This is the case for the 2 meter and 440 bands. The transmitter is not extremely broad banded.

To me it seems highly unlikely that some lucky key combination will open up transmit on 220 MHz. If that were within the radio's capabilities, it would be a major selling point (making the FT-100 superior to the IC-706MKIIG, among other things), and surely Yaesu wouldn't hide such a valuable and non-controversial feature.

As for 80 and 160 meters, all you need OM is an antenna! :-)

I had a 5-minute long QSO today using the FT100 on RS13 by estimating Doppler shift and adjusting it while I was talking based on the time of the pass. That's the third pass RS13 pass I worked from my car using a dual band whip for the uplink and the ATAS100 for the downlink. Later, I tuned in FO29 during a direct overhead pass and was able to copy several stations in a QSO and heard a few more calling CQ. I have not yet mastered the fine art of tuning inverting transponders on a half duplex rig. At first I wasn't sure I could operate at all as the default SSB mode for VHF is USB and it didn't appear to allow LSB, but I had the manual handy and it explained that this could be changed by holding down on the MODE button for 1/2 second. After listening for more than 10 minutes I couldn't take it any more and estimated the Doppler shift and near the end of the pass gave Randy (N7SFI) a call and much to my surprise I heard him call me back! The bird was nearing the end of its pass so there weren't any more exchanges that I could hear, but it just goes to show you that it is possible to use the FT100 as a makeshift satellite rig. I was just using a dual band mag mount antenna for the up/downlink so it was pretty surprising that it worked at all.

Lots of folks work the FM birds with half duplex HTs so I think this will be a great radio for working FM satellites. The DUP memories will store frequencies with the SPLit function enabled so you can store all the frequencies for satellites in those memories.

I am thinking of how I can use the my Arrow antenna since it would make a great portable station that's always ready to work the birds on a moment's notice.

My e-mail has become hopelessly tangled. I don't know whether I responded to you about this or not, but I really appreciate you're checking this out for me. Folks seemed pretty sure that it was TTL levels, but you've also confirmed that it idles at a high state. Thanks ... as it turns out, this is the same spec as the ICOM 706, so it should make the adaptation somewhat easier.

There must be a FREEBAND transmit mod for the FT100!!!
Both the FT-50 and the VX-5 have one!
Then you would be actually just be limited by the electronic
COMPONENTS (power would taper off or VCO would not lock
as you tune) and not the CPU ("off" indicator when transmitting).

Where did the current CONVOLUTED mod come from?????

.....Keith WE6R My webpage; Six Meter Repeater list and a

2504. re freeband mod....

Yahoo group: FT100 (1998 — 2000)
Date: 2000-01-29 16:31:05 UTC
From: Keith
Topic: 2504 Message: 2504

I know it is asking too much for it to tx everywhere, but I would think there is a mod that would open up the "brain". Several of my other Yaesu rigs will tune almost anywhere, (ft-212, ft 712, ft-4700, ft-50, vx-5).

Now that I think about it, the ft212 series and the ft4700 had a mod similar to the ft-100, where you enter numbers, but they were the upper and lower limits in FREQUENCY!!
.....Hmmmmmm.....

The FT-50 will tx on the 220 band, it is very low power, but good for testing.....
30-50 Mhz would be nice too, for testing and emergencies....
108-140 too, same reason.....Keith WE6R

Keith:
What is it that you're looking for? The "mod" opens up transmit for
anywhere within reason.
My guess is that the "mod" came somehow from a Yaesu engineering source.
It's unlikely that anyone would just happen upon such a sequence.

Modifying the Ft-100 to operate in the 220 band should be part of the FT-100 knowledge base, Improvements, Techniques, Fixes, etc. After all 220 is a legal ham band. I have heard roumours that the european version will easily do so. I know for a fact that the european version will receive the cell frequencies and tune continuously from hf to vhf right out of the box. The difference is that the main cpu chip is different on the american version to be F.C.C. accepted. There is a lot less politics designed into the european rigs and that usually goes for all the manufacturers of ham equipment. I have a friend that owns a Ft-847 in the european version that works the 220 band and that's bone stock out of the box. Considering the architecture of the rig with its one p.a. final does all design and the fact that the rig already receives 220 makes me believe that the mod is very possible. The mod is probably similar to the mars/cap mod. Anyhow thats my opinion, Steve N2JBX GARY GADWA wrote: > > From: "GARY GADWA" > > All this Free Band and Frequency Modification talk......leads me to believe > this list is falling apart at the seams..... > If that what you want to do then search the Internet and you will find the > Mods. > I'd like to see this list stick to the FT-100 knowledge base, Improvements, > Techniques, Fixes, etc. > > My Two Bits, > > GARY > W7FSI > > ---------- ONElist Sponsor ---------- > > GET A NEXTCARD VISA, in 30 seconds. 2507. FT100 modification

Yahoo group: FT100 (1998 — 2000)
Date: 2000-01-29 03:05:03 UTC
From: Tim Lemmon
Topic: 2507 Message: 2507

Just an FYI.

I decided to perform the out-of-band modification earlier today. My rig has a serial number ending in 1231. (I'm not sure if it's a late model or not)? Anyway, I tried it a few different times, but it just wouldn't work.

After doing both the CPU reset and restoration of default memories, the modification went as it should, and all works well.

-Tim

2508. AW: Mods

Yahoo group: FT100 (1998 — 2000)
Date: 2000-01-30 08:09:05 UTC
From: Hanno, DG8JZ
Topic: 2508 Message: 2508

Hello,
my one is of course a european, I did all available mods and it does not transmit on 220. I can receive without any gaps and no blocks, but no TX on 220. The 2m and 70cm band is very broadbanded TX.
Just to let you know....

2509. Results from my ATAS-100 Web Site & Comments

Yahoo group: FT100 (1998 — 2000)
Date: 2000-01-30 17:53:41 UTC
From: Steve Teegarden
Topic: 2509 Message: 2509

Aloha All...
I received a fair amount of inquires from my ATAS-100 Web Site http://www.frii.com/~cayman in reference to mounting the antenna and the FT-100 Radio and so forth. The most common questions are HOW to mount the ATAS-100 on a never ending list of vehicles. I keep referring the query to GEOTOOL for anything that even resembles a Truck, or SUV requirement. The Smaller cars, and other types of vehicles is something that seems to be a real difficult decision as well as a challenge.

3 Really important things to remember (I know , a re-hash) is to GROUND, GROUND, GROUND ! I published SWR curves and some new "Curve" charts on my web site to give hams an idea of what to expect, in the real world. (Your milage may vary.. :0) Its by no means a scientific method, but does reflect (Poor attempt at humor) the general configuration and setup on a Ford Ranger Truck.

So to all those Hams that Santa treated REALLY well this past Christmas, remember that the Big and HEAVY antenna is an awesome piece of equipment, but it needs a SOLID base to mount to !

So in summary here is my "List" of things I have found:
1. Ground the ATAS-100 with solid connections to the Frame of the Vehicle.
2. Provide power from the BATTERY ONLY ! (How I did mine is on my web site...)
3. DO NOT use the DIPLEXER Method . (MY OWN PERSONAL OPINION , Before you flame me... :-) The ATAS-100 as a VHF/UHF Antenna is well how do I say... Poor ? hehehehehe I use a Dimond Dual Band gain Antenna on a L bracket mounted to the left side of the Hood area and have excellent results here in Colorado.
4. I LOVE the Remote Kit. It allows for the Boing 747 Fan noise to be hidden somewhere else, and makes the front of my Console a lot less cluttered, and heavy. (I also changed my Console setup over the past few days , and put new pictures on the web site. STREET PILOT COLOR GPS is now the toy of the week ! hehehehe
5. I found just like alot of other FT-100 Owners that the radio is spectaculair at alot of things, and fair to good at others. The main reason I like it is that it does furfill alot of requirements for me in a small package, and its durable. I have 4x4 all over the Colorado back country this past summer, and thru heavy winds, rain, snow, mud, and Car Washes... Radio and Antenna have worked flawlessly...

So there ya have it.. My attempt at letting you all know just one guys opinions, and end results of this setup for the last 9 Months. As usual your milage may vary....

Best of Aloha , and hope to work you soon back in Hawaii !

Steve

From: jack.beckman@mciworld.com
Topic: 2510 Message: 2510

I'm having trouble setting the power level on HF. I have gone to menu item 21 and set it to "5" for each mode, yet when I key up to tune my antenna at home, the power meter reads around 100w on both the rig itself and my SWR bridge. What am I doing wrong?

Hi jack, Can you listen to your signal? Maby it's interference instead of real power! If that is so, plz watch out! I notice that when i use a SP-8 external speaker that i have some interference and gives the FT-100 full power. Since is use a Ferrietcrale it's almost done but with my antenne to south-south-east it's comes again. Note excuus for my English.... Hello to all,
Has anyone installed the ctcss decode board in thier FT100? If so, is there any problems with it, such as not deocding certain tones or bad audio from the board? (tones do not match standard tones, etc)???

Thanks for any help,
JJ

2515. Help setting memory channels on FT-100

Yahoo group: FT100 (1998 — 2000)
Date: 2000-01-31 14:41:37 UTC
From: Johnny Rico
Topic: 2515 Message: 2515

I am having the devil of a time setting all the local repeaters up using the memory channels. What I want is real simple: I have about 30 repeaters that I would like as memory channels 1-30. Instead, when I do it starting with MCH1, the next channel is home, the next QMB, etc. When I hit the V>M briefly, and turn the select button, I do not get a bunch of unused memory channels like the book says. What I get are all my presently used memory channels. I do not wish to overwrite these, so whatdoido? This is giving me a serious case of frustration with what is otherwise a very intuitive and well-thought-out user interface.

Any help will be appreciated. 73

Check the book, look very carefully. You'll find something in there the mentions if you hold in the select button for a couple of seconds (I believe its the bottom lnow on the left hand side), it toggles on the option to only have programmed memories scanned/displayed. Turn that off and you'll be in business. Hello Jarrod. I recently installed the decoder board inside my FT100. Ain't no biggee. (MUCH easier than installing a filter)! I've tried mine out with one local 2 meter repeater that encodes PL. The new decoder worked just fine. One nice thing if you're trying to find the PL tone of a signal is that you can use the main tuning dial to sweep all the PL tones quickly. The decoder seemed to work rather quickly too. Other than that, all my audio sounds fine - and I ain't no DJ neither - hee hee. Good luck; -Tim _____ At 03:38 AM 1/31/00 PST, you wrote: >From: "Jarrod Smith" > >Hello to all, > Has anyone installed the ctcss decode board in thier FT100? Welcome to the fold. A TCXO It's a temperature compensated oscillator. It' just a device that keeps your radio very very accurately on frequency no matter what the temp. Not normally needed unless you live a land of extreme temp changes and you are a nut for keeping on frequency down to the milli/micro hertz :). 2522. ATAS-100 mounting (again...) (FWD)

Yahoo group: FT100 (1998 — 2000)
Date: 2000-01-31 22:02:50 UTC
From: Bob Sayers
Topic: 2522 Message: 2522

Hi, all;

I've been following the discussions about mounting the ATAS-100, and ensuring low SWR by grounding, grounding, and grounding; with great interest, and the comments mirror my own experiences with my Suzuki Vitara (aka Geo Tracker, Suzuki Sidekick).

Now, who'd like to stick their neck out with any recommendations for using the ATAS-100 on a fiberglass-bodied car? Is it even worth trying?

My next car, about to be delivered, is a Liege sports car. (Never heard of it? Take a look at http://www.ashford-perf.com/Liege). I want to mount the ATAS on the rear of the car, immediately at the base of the hood (sorry, Anglo-Saxon term, please translate to North American for "convertible soft top"). The area below the mounting point is a luggage compartment (oh, all right; "trunk").

My current plan is to line the entire underside of the top surface of this compartment with metal mesh bonded to the fiberglass, and ensure that the antenna base is in good electrical contact with this, and provide multiple earth straps from the mesh down to chassis ground.

I anticipate that I shall probably also have to treat the underside of the bonnet, sorry, hood; in the same way, and probably also the firewall, too.

Any other comments, anyone?

Bob, G8IYK

PS: if you respond as most people do on seeing the picture of the Liege for the first time, join our Club site at http://www.onelist.com/community/Liege_Car_club

Marcus,

Thanks for the tip. I have been working with fellow FT-100 owner W8KC and we have come to the conclusion that there is something in the shack setting off the rig. I need to do more investigating to find out what the problem is, but I think the rig itself is OK.

Jack

From: PowerWerx
Topic: 2524 Message: 2524

I told a few of the list members that I would post when the FT-100 power connectors were in stock.

They arrived today - only 100 though.

Check the pictures and you will see that they are OEM parts.

2525. Problem with Using Two Antennas

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-01 01:14:05 UTC
From: porterpe@southeast.net
Topic: 2525 Message: 2525

Today my Comet duplexer bit the dust. I have been considering using a 2M/70CM antenna for VHF/UHF anyway. So I ran a new coax line and hooked up a 5/8 wave 2M antenna until I could get a new dual band antenna.

Evenything seemed to work well until I tried to transmit on 6 meters with the ATAS100. RF from the ATAS100 is getting back into the rig from the 2M antenna causing the rig to smell hot (not a good thing!). So long as I operate anywhere other then 6M everything is OK. The problem only seems to occur with 6M getting into the 2 Meter antenna.

Has anyone else experienced this problem. If so, what did you do to fix the problem?

2526. Re: Problem with Using Two Antennas

5/8 wave 2 meter antennas are sometimes resonate at 6 meters ! I have
used a 2 meter antenna for 6 without much swore so you
may be getting some kind of feed back into the finals.
I don't have any suggestion about how to solve that problem maybe
someone else can make a suggestion on how to decouple the antenna.

A TCXO is a temperature compensated crystal oscillator. As an option it will improve the frequency stability of a rig. Particularly when the rig is newly fired up, and the internal temperatures are stabilizing. Most modern rigs do not really need this option, although it can be particularly useful on the digital modes, particularly very narrow-banded modes such as PSK31, where even a few hz drift can be noticeable.

I do not yet have enough experience with the FT-100 to know if it can benefit significantly from the apparently optional TCXO-8 module? Comments? Ease of installing this module?

I am a new HAM (passed 2, 3a, 3b last week and now working on 5wpm).
I recently purchased an FT100 to satisfy pretty much all of the radio
needs I am interested in. I see many radios have optional modules called
TCXO, but no where can I find out what this does, why someone might use
it. Can someone please enlighten me?

Appreciate the help.

Another note Lee... I am mounting my FT-100 Control head up near the winshield. In the Olds Bravada there is a molding that comes up and arond and I made a 'L' bracket to mount the head. Works great and is easy to see whithout taking your eyes off of the road. 73, Dave PS I have the HS1500 Screwdriver antenna just off the back left tailight. It is mounted from a bracket in the trailer hitch. I had it made at a Custom Welding/Fabricating near here. BTW I ran some numbers on an RF saftey program that I have. At 50 watts average power the limit is about 3 ft for areas that you control and about 7 ft for areas out of your control. I see little problem with the hood mounted antenna because you are somewhat shielded by the cab and you can see who is approaching your antenna. The rear mounted one is more out of your control and if you are operating stationary, walkers could be exposed to RF above the limit. These limits are very conservative and routinely exceeded by significant amounts in my industry, Magnetic Resonance Imaging. Lee, nice job.
FWIW the one thing that bothers me, and a LOT of people do it, is putting the radio inside the center console of a vehicle. Surely there's no real ventilation in that compartment, and 100W will heat up the little air that's in there in one big hurry.
Or maybe that's just a concern where I live (Phoenix)...

Oh and BTW, my understanding of OST-65 (the RF exposure stuff) is that the public exposure level is figured for a 6 min on-54 min off duty cycle. Anyone who hangs around that close to my truck for 6 min will probably arouse my security suspicions before they are 'exposed' sufficiently. Or for those who really want to comply, I have an ample supply of OSHA-approved warning signs. Imagine the reactions of other drivers with an approx. 5"x7" bright yellow sign saying "RF EXPOSURE HAZARD"! If your antenna is rear-mounted it may solve any tailgating problems! hihi

Hello all,
this is a plug for powerwerx. (www.powerwerx.com)
Without getting to wordy I would just simply like to say that though my own fault I did not place my order right. After talking to Ken he went out of his way at his own expence (and heartache I'm sure) and took care of it. He was very friendly and polite and I highly recomend powerwerx for their service and quailty connectors. Keep in mind I have never ordered from them so there was no loyalty thing going on here. Just a honest decent man.

Best Regards, Dan

My earlier info directly from Yaesu USA was that all models being sold, regardless of serial number, are up-to-date with any and all changes or modifications that have been applied thus far.

So, while it's cool to get an "H" or "I" in the number, they're no different than the "D" or "E" models.

Having said that, if anyone can demonstrate that Yaesu is not telling the truth, please let ME know and I'll follow up big time with 'em.

Thanks!

2543. FT100 faq input

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-04 06:05:45 UTC
From: Lee810@aol.com
Topic: 2543 Message: 2543

Is there any interest in updating the FAQ for the FT100? I'd like to see one as the archives are hard to search and the searches turn up a lot of hits and very little relevant information. The FAQ that is on the 'files' page of the onelist is pretty limited and has not been updated since May, 1999. Here it is in it's entirety:

---------- FT100 faq ----------

Yaesu FT100 Frequently Asked Questions

PLEASE READ THIS FAQ BEFORE POSTING A QUESTION TO THE FT100 MAILING LIST.

This FAQ is made from the archives of the FT100 mailing list based on the OneList service. If you think something is missing, please forward it to FT100@onelist.com and after it gets hashed out, it might make it to the FAQ. Please address any comments about this FAQ to ny4i@....

Q. I have heard of several FT100's dying. What is happening to them?
A. Several users have reported the VHF/UHF final in the radio dying. The radio
works perfectly except that the power output on 2m and 440 goes to about 1 watt.
The radios were sent back to Yaesu and returned in about 8 days. (The author of the FAQ
was has one of the radios).

Q. Can the radio be modified to transmit out of band?
A. Yes, it can. Check out http://www.ns.net/~rtwod2/ft100.htm for details on the transmit mod.

Q. I can hear broadcast stations in places they should not be. SOmetimes on 10 meters or on 10.0000 (WWV). What is wrong?
A. First, you are not crazy, or hearing things. Some radios do this. Several people have
experienced this. There is not a solution to this problem yet. If you experience it,
please send an email to Yaesu tech support and to ft100@onelist.com.

Q. What are some resources available on the web for the FT100.
A. You can check the FT100 archives on Onelist. Also, try
http://www.wm7d.net/hamradio/ft100/links/
as a website dedicated to the FT100.

Q. I am having a problem with the remote kit. Any ideas?
A. Some users reports problems with the remote kit. One solution was to put a Radio Shack "wrap-around" torrid on the line.

Q. Whenever I tune on HF, the radio seems to stop receiving until I stop tuning the knob.
What gives?
A. This problem has to do with scanning. If you have the squelch open, and use push the up or down
button on the mic, it puts the radio into scanmode. Since the squelch is open, the radio stops
right away. If you tune the VFO knob, the receiver seems to disappear until you stop. You will also see the icon in the scanmode at the point. Simply tap the PTT button or go to the scan menu and turn off scan.

Q. Hey, I saw several questions concerning the FT100 not transmitting when used in a rolling
stagecoach over the Oregon trail during a full-moon, but I did not see it here in the
FAQ. What gives?
A. While every attempt is made to keep the FAQ current, it is certainly a work in progress.
The author will try to keep it as current as possible, but sometimes I am using my FT100 too
much to have time to update it.

---------- END

Writing and maintaining a FAQ is not a very glamorous job. You can't just put anything in there or it will read like some random thoughts scattered down a page. The questions truly have to be frequently asked, or undocumented in the manual. Otherwise it will collect odd facts and seldom used information.

Basically, I'm soliciting input for the individual who will assemble the information and periodically update the FAQ. My guess is that ny4i has received little, if any encouragement to add material or update the faq. Maybe people on the list don't visit the onelist page very often to notice that it's sitting there hidden among the other files that have been collecting.

2544. RF exposure considerations

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-04 06:15:36 UTC
From: Lee810@aol.com
Topic: 2544 Message: 2544

I got some feedback on my most recent posting regarding the choice of mounting of my ATAS100. One of the responses was that I was violating the FCC exposure rules in mounting the antenna on the hood and exposing myself to large RF fields. I've studied the ARRL materials and could not estimate the amount of RF field that would be likely to surround the antenna or how much would penetrate the vehicle. I will use a field strength meter to measure how large a field is getting into the vehicle and determine if I am over the maximum exposure limits. I'll report back to the list what I find as I'm sure a lot of others would be interested as I'm not the only one who has mounted the ATAS on the front of the vehicle.

2545. FT100 display/chassis mounting

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-04 06:53:44 UTC
From: Lee810@aol.com
Topic: 2545 Message: 2545

I received several responses about the mounting of my FT100 display on the center console in my Durango. Before I mounted the unit there I wondered if it would compromise my driving safety since I'd have to take my eyes off the road in order to see the display on radio. I came to the conclusion that whenever my eyes were focused on the front panel display, it compromises the safety of my driving so I try to keep it to an absolute minimum. Therefore, I spent a lot of time learning to control the radio by sense of feel and by listening to it and only glance at it occasionally when checking to see which band I'm on.

Another trick I use is that the 'func' key on the radio cycles through 10 menus. One of the menus has a 'beep' that is distinct from all the others. I use this beep to let me know when I've cycled all the way through and can count upwards to the menu of interest, (usually the menu with the TUN function on it which is 6 steps beyond the distinct tone beep). That way, I am not watching the display for extended periods of time. I also have the memories set up with local frequencies and do not try to set them up while I'm driving along.

Most of the time, I'm tuning the main dial listening for stations and there's an advantage to having the controls close by for that so I'm not reaching up on the dash all the time.

I mounted the chassis inside the console which is somewhat confined, but I made sure that the fans were not blocked and that the chassis is resting on a metal air-conditioning duct. The summer temperatures are the maximum the radio will experience so the air conditioning duct will stay cool and prevent the temperature from rising above the specified limit for the radio (60C/122F). In the winter time, the internal temperature of the vehicle isn't as much a concern. The size of the space that you mount the radio in isn't nearly as important as maintaining airflow through the radio and making sure the temperature rise the radio causes is not excessive. If the air temperature rise is only 5 or 10 degrees F and well below the operating specification of the radio, there's not much cause for concern.

Can Yaesu explain how a brand new one is a 9D and others bought before are
9I ? How does their numbering work? How can you tell it is up to date??
-----Original Message-----
From: Bill Tubbs [mailto:piperbill@...]
Sent: Thursday, February 03, 2000 9:43 PM
To: FT100@onelist.com
Subject: Re: [FT100] Brand new FT-100 with a 9D sn?

From: "Bill Tubbs" <piperbill@...>

My earlier info directly from Yaesu USA was that all models being sold,
regardless of serial number, are up-to-date with any and all changes or
modifications that have been applied thus far.

So, while it's cool to get an "H" or "I" in the number, they're no
different than the "D" or "E" models.

Having said that, if anyone can demonstrate that Yaesu is not telling the
truth, please let ME know and I'll follow up big time with 'em.

Thanks!

From: n3jpu@...

I should have thought to find this list earlier before I bought a
FT-100.

Just had my new one delivered yesterday (2 Feb 2000) from HRO.
These were suppose to be just in and mine has a 9D sn.
Looking at the past posts it looks as though this would be
a very old one, how could this be?

This one is starting to smell bad. From the below language cited by
Bill Tubbs, it would appear that Yaesu is taking in returned radios,
updating them, repacking them, and selling them as new. In many
states, this is a prohibited consumer practice, as "repacks" are not
to be resold or represented to consumers as "brand new" merchandise.

On the other hand, if they recalled inventory from dealers before it
was ever sold at retail, updated the units, and returned the
merchandise to dealers, then the units would be considered brand new
in that they had never been sold at retail. However, I doubt this was
the case, as the early radios were selling like hotcakes last Spring.

I can't think of any exception here just because it is amateur radio
gear, and not a "mainstream" small consumer appliance. Do I smell
class action law suit?

2548. Re: RF exposure considerations

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-04 12:30:43 UTC
From: Charles Scott
Topic: 2544 Message: 2548

Lee:
Aside from this RF exposure limit stuff being a bunch of pseudo-science nonsence (at the levels they target), I don't think you can easily predict what your exposures are going to be with any particular installation. The actual level will be dependant on things such as the characteristics of the antenna, size and orientation of the vehicle's windows, how the vehicle is assembled (how well bonded are the metal to metal attachments), the shape of the vehicle, exact placement of the antenna, the exact frequency of operation, how well RF is decoupled from the transmission line, and other wiring or conductive parts that could carry and reradiate. Did I miss anything? In other words, you could very well try to pick the best location for the least RF exposure then find out by measurement that it's the highest exposure option when operating on your favorite frequency.
I don't mean to be critical, but there's been a whole bunch of Hams and other communications users who've been running high power mobile and fixed stations for a whole bunch of years and there's no body of evidence that non-thermal levels of exposure to non-ionizing radiation has any real effect (electric blankets included). If however you want to be concerned about exposure limits as a technical exercise I commend you and would be very interested in your findings. If nothing else, the results could be helpfull in attempting to limit problems with RF affecting equipment inside your car, such as getting into your mic input on the radio.

OK, my 2 cents. I purchased my ft-100 from HRO in Denver 3 weeks ago. It is a 9D as well. Since I have been reading this list for a while, I was initially concerned, but I have not had any problems yet (OR I have not been able to detect my problems!) Is there a magic key press sequence that would reveal any info that might determine the actual revision level of this radio? Like the others, it smells a little funny getting a "new in inventory" radio with a really old date code. I don't think this is something being done by HRO. 73 John Kane W5JAK On Fri, Feb 04, 2000 at 07:08:08AM -0500, R.Makul K1XV wrote: > From: R. Let me get this straight...

There are a number of serial numbers out indicating different manufacture dates.

The manufacturer has told at least one person that it doesn't matter. They are all up-to-date.

There are some who feel that the manufacturer is not speaking the truth.

Yet, those same doubters (1) have and continue to use that manufacturer's equipment and/or (2) will throw $1000 or more at them to purchase their equipment.

Come on guys. What good does it do to bring it up here? If you have a beef with or are skeptical of the statements made by the mfr, take it up with mfr.

Enjoying my little FT-100 and I don't even remember what the serial number is.

From: hollozzz@gateway.net
Topic: 555 Message: 2554

Ok, what we have is a decent antenna for its size. Good performance on 6 thru 40 meters so-so performance on UHF & VHF. What this antenna lacks is the ability for general coverage receive much below 40, this is because of the Hi Q of the design. Since most operators are using a separate antenna for UHF & VHF here is my idea.
There must be a matching network for UHF & VHF and probably a device for broad band matching on HF. If these networks were modified (or removed), when the antenna is fully retracted,(the inductor out of line) possibly the antenna could act as a 5 foot whip and therefore listen on the lower bands.
I ran into a web site awhile back where this Ham regularly dissembled his ATAS-100. Does anybody know this sight? And better yet does anybody have any experience dissembling the ATAS-100?

Comments, thoughts?

Cliff N0HC

I heard incredible aurora flutter last night on 20 and 40 meters, and I heard a California station late on 20 meters that I'm sure I was only hearing via aurora bounce. Then, to top it off, I think I heard my own auora bounce. My Yaesu FT-100 has full break in CW mode, so even at 30 WPM I can receive briefly between the dits. And what I heard (I believe) was my own echo with full auora flutter! It was great. I went outside to look at the sky but didn't see anything. Any reports from up north?

I just received an FT100 from AES. It has a serial # in the 9D02XXXX range. Has anyone determined any rhyme or reason to these serial numbers? I know that serial numbers do not have to be sequential, although this is counterintuitive to most folks including myself. Has anyone matched serial numbers with manufacturing dates? Also, is there a dataplate anywhere on/in the radio which would indicate the series of modifications done by the factory. I know avionics often have this "pedigree" but I'm unaware of the custom on Yaesu equipment.

2560. CAT interface

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-08 20:37:00 UTC
From: Timothy H. Heaton
Topic: 2560 Message: 2560

Have any of you tried running the FT-100 from a computer? I just bought the CAT interface cable and have been trying to write some software to run it using the meager guidelines provided in the users manual. I have written software for serial port devices before (calipers, digitizers) but nothing quite like the FT-100. I tried many things before getting any response from the radio. My only success was running 9600 baud through a null modem reverser. With that, if I send a string of 5 bytes to the radio, it sends 5 bytes back to the port. As yet I have not gotten it to change the radio's settings, nor have I been able to interpret the return string. The return string changes depending on the input, but sometimes the last byte returned varies. Usually all the bytes are in the 224-255 range (one was 62), which seems odd.

If anyone has any comments/experience/suggestions I would be happy to hear them. It would be fun to create some simple software (freeware) to use with the radio. If the manual contains a complete table of all the possibilities, then I'm afraid the possibilities are somewhat limited (I see no code to change CW speed or tinker with the memories, for example). But even the ability to switch frequency/mode with the click of a mouse or read the frequency directly into a computerized logbook would be useful.

From: John Hansen
Topic: 2560 Message: 2562

I've not done any PC software for the FT100, but I have written a lot of code for the IC-706. In addition, I'm currently developing an application where a PIC communicates with an FT100. In the process of doing this I've accumulated the programming sections of the FT100 and FT1000 manuals (thanks to the folks on this list!). The basic data communication protocol seems to be the same as for my aging FT-736 and I have now gotten the PIC to talk to the 736. In looking over the FT100 manual its interesting that there doesn't seem to be a discussion of the baudrate that is to be used. In the FT1000 manual and the FT736 manual it says specifically that communication must be at 4800 baud. All three manuals specify a delay of 200 ms between bytes. I've found that just specifying 4800 baud seems to work just fine (without my explicitly setting an additional delay). I suggest changing your data rate to 4800 and having another go at it. I recently picked up an FT-100 and was kind of interested in the CAT part of the radio. However, I believe that I read somewhere that Yaesu doesn't have any CAT software for this radio.

If I go out and buy the CAT interfact, where can I get software to use with this radio??? Also, will the same software work with my older FT-767???

Thanks a bunch, John. 4800 baud (WITHOUT the null modem inverter) did the trick. The FT-100 now responds to my commands, such as changing the mode! (I had tried 300, 1200, and 9600 baud, but for some reason it never occurred to me to try 4800 baud. :-] As you mentioned, the manual isn't very helpful.)

Of course every solution begs another question. hihi. Some commands solicit a response from the radio, such as its current frequency and other settings. But when I expect it to send back 8 bytes, it only sends the first three. I have tried all kinds of delays and buffer sizes with no improvement. Do you use any special protocols for receiving data from your radios?

From: John Hansen
Topic: 2560 Message: 2570

I'm not sure. I'm much more experienced with the ICOM stuff. I'm writing a program for a PIC microcontroller that will take input from a numeric keypad and do direct frequency entry for the FT100. As a result, I'm never interested in receiving data from the radio and haven't even hooked that data line up. However, I can offer a couple of suggestions. I think you might find it useful to get the appropriate pages from the FT1000MP manual. It's much clearer and more detailed than the FT100 manual. According to this manual, for example, you should be able to get the radio to dump all of its operating information by giving it the string:

00h 00h 00h 00h 10h

Or, to get just the vfo data you should send it:

00h 00h 00h 03h 10h

Since this isn't documented in the manual for the FT100, I don't know whether it works on that radio or not.

Maybe you can help me with a problem. The follow command sequence is supposed to cause the radio to go to memory #1 on the fT1000MP. I'm extremely curious to know whether it also does this on the FT100:

00h 00h 00h 01h 02h

If you are able to determine whether this does anything on the FT100, I'd be really curious to find out.

This code is in the FT-100 manual (though it is unclear what "P1" [the
3rd byte] should be) for the same function. I get odd results. The first
time I send this command, 8 bytes are returned, and thereafter 20 bytes
are returned. But when I string the outputs together I get a full repeat
every 32 bytes. The manual only lists 16 bytes of operation info. For
some reason my serial port buffer isn't grabbing the write number of bytes
are is storing the leftovers for the next round.

>Or, to get just the vfo data you should send it:
>
>00h 00h 00h 03h 10h

This command gives the same result as the one above. I don't think any of
the bytes except the last one matter, though the manual is unclear about
what the 3rd byte should be.

I tried this command and got absolutely no result. Sorry, but apparently
it doesn't work on the FT-100. It appears that Yaesu has tried to keep

the commands uniform between its radios, but that doesn't mean they all support the same features. The FT-100 could get by with a much smaller instruction set than the one it uses (assuming that the functions listed in the manual are the only ones truely available), but apparently uniformity argued against this.

I would be happy to try anything else you would like to propose. It's easy to change the code in my routine and see what happens.

BTW, I downloaded the trial version of TRX-Manager, and it works fine on my radio. From what I can tell, it doesn't support any functions on the FT-100 that are not documented in the manual. I wish more possibilities were available (uploading and downloading memorys, setting CW speed and HF power from the computer, etc.), but no one seems to have found a way to do those things. My plan is to create a palate of favorite frequencies/modes that I can choose using the mouse, and read the radio's frequency directly into my computer logbook. At this point, nothing else available appeals to me.

If you're a programmer I'd be happy to share some code with you. I only started two days ago and don't have very much figured out yet. I am programming from within my Microsoft Access logbook using the Visual Basic language. You will need Visual Basic loaded on your computer to use the Microsoft serial port communications functions (whether you are programming in Visual Basic itself or from within Access or Excel).

If you're not a programmer, I suggest you download the trial version of TXR-Manager from F6DEX and see if you like it well enough to buy it. It doesn't appeal very much to me. There aren't many available CAT features that are easier to use from a computer than from the radio. The computer VFO is a pain in the neck. The hard-to-reach menu settings of the radio (what the computer would be most useful for) are apparently not available from the CAT interface. But see what you think.

2576. Is an FT-100 Keypad worth doing?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-10 01:32:30 UTC
From: John Hansen
Topic: 2576 Message: 2576

I am interested in the opinions of FT-100 owners on the following:

I have been working on creating a direct frequency entry keypad for the FT-100. I've basically finished it, but it has yet to be tested. I've found that the number of things you can do through the computer port on the FT100 is relatively limited compared even to other Yaesu radios. The keypad that I did for the IC-706, for example, also had the capability to switch between VFOs, turn split on and off, and directly access memories by number (e.g., push M45 and it went to memory number 45). While it is possible to switch VFOs and turn the split on and off on the FT-100, it appears that there is no way to access the memories via the computer port. This strikes me as amazing on a radio that has so many memories, but it apparently is true.

So here's the question. Is there any interest in a direct frequency entry keypad kit for this radio if it does not have the capability to access the memories? If so, would having any of the following features available on the keypad be useful, and, if so, which ones are the highest priority?

- Ability to key and unkey the transmitter.
- Ability to toggle the repeater shift between +, -, and simplex.
- Ability to select filters.
- Ability to set the CTCSS tone

These items do seem to be possible via the computer port, even though direct memory access is not.

Thanks for your views,

John W2FS

For me, direct memory access is not an issue. I don't even have any memories
set at this time.

This strikes me as amazing on a radio that has so many memories, but it apparently is true.

So here's the question. Is there any interest in a direct frequency entry keypad kit for this radio if it does not have the capability to access the memories? If so, would having any of the following features available on the keypad be useful, and, if so, which ones are the highest priority?

- Ability to key and unkey the transmitter.
- Ability to toggle the repeater shift between +, -, and simplex.
- Ability to select filters.
- Ability to set the CTCSS tone

These items do seem to be possible via the computer port, even though direct memory access is not.

Thanks for your views,

John W2FS

2579. New Ham needs ATAS100 and FT100 Advice

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-10 12:29:19 UTC
From: Stoli126@aol.com
Topic: 2579 Message: 2579

Hello all
I recently purchased the ft100 and the atas100 automatic tuning antenna. I had my two way radio shop that I deal with for other radio needs install the radio and the antenna on a Ford Expediton SUV. After the antenna was mounted on the bumper we kept getting the high swr icon. Therefore after some good advice from you people in the group we went to move it to the hatchback door after purchasing the k400 mount. After the mounting attempt we went to use the rig and the antenna did not go up or down even manually. Today I am returning it to Yaesu for replacement Hope it doesnt take long. I am curious if any one else has had problems with the antenna. My main question is realizing the antenna does not tune on 75 meters can I purchase a ie hamstick for 75 and just switch from the atas 100 to the hamstick or what should I do if I would like to work 75 meters. I could use some advice as to what company handles the hamsticks and is this the route to go . Do I have to purchase a diplexer if so could I have the name of the company that sells the hamsticks and the diplexers.
Many thanks

I hope your atas 100 lasted longer than mine I miss it but on the other hand have not had the opportunity to see it work since we kept getting the bad readings

I would be extremely interested in direct-frequency entry!

>
>- Ability to key and unkey the transmitter.

Nah

>- Ability to toggle the repeater shift between +, -, and simplex.

Yup

>- Ability to select filters.

Yup

>- Ability to set the CTCSS tone

Definately. Goes hand-in-hand with direct freq and offset for VHF/UHF.

I'm a buyer if it is well made. Consider using a PIPO-pad seen extensively
used in the 70's for the buttons. They have detent-click feel. I absolutely
HATE flat, no tactile feel buttons.

Looking forward to it!

From: Timothy H. Heaton
Topic: 2576 Message: 2581

Good morning, John:

I stayed up late tinkering with the FT-100 interface. My success was getting my computer screen to display the VFO frequency (updated every 0.1 seconds). I tried the memory access command you sent me again, making sure I was in memory mode, etc., and still no luck. :-(

I also own the little Yaesu VX-5R, and it has three memory advantages over the FT-100: 1) keypad entry, 2) text labels (so you can remember what the channels are), and 3) upload/download capability with a computer. It is bewildering that the FT-100 lacks these capabilities.

BUT, if you're running the FT-100 from a computer, why not just ignore the built-in memories and create a memory feature within the computer program. You could have all the advantages of the VX-5R and many others as well. Even split VFO and scanning features should be possible, and there would be no limit to the number and type of memories. The only drawback would be that the features would only be available with the computer hooked up.

What language are you using to write your software, John? When you speak of "keypad entry" do you mean computer keyboard/keypad entry, or are you thinking of some other keypad device? The replies to your query suggest some confusion on that point.

Gook luck with your programming project. I'd be happy to test it for you.

-Tim (WB7NMY)

2582. New ATAS-100, am I missing parts?

I finally picked up a new ATAS-100 from Texas Towers yesterday.

When I opened the box, there were only two things in it:
1) The screwdriver antenna itself.
2) The whip.

There was nothing else. No instructions, no information sheets,
not even a packing list.

Not even a screw to fasten the whip onto the antenna base.

This all seems so odd, can someone please let me know if I am
missing anything?

I had the same situation with my ATAS-100. The screw to secure the whip to the base was already inside the hole - just enough to be out of sight at first glance. All I had to do was: 1. Insert the whip into the base 2. Tighten the screw 3. Put it on the car Cheers, Abe Schachter N3BBF cbarrera@... on 02/10/2000 11:49:46 AM Please respond to FT100@onelist.com To: FT100@onelist.com cc: (bcc: Abe Schachter/DEF/CSC) Subject: [FT100] New ATAS-100, am I missing parts? 2584. CAT Interface

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-10 18:07:37 UTC
From: Rich Bay
Topic: 2571 Message: 2584

Yesterday I received the CAT Interface Cable.

I am controlling the FT-100 with a real neat little program called TRX-Manager. The web site on this product is http://ourworld.compuserve.com/homepages/f6dex/
The program interfaces with a bunch of different radios and has a special driver for the FT-100. It adds some nice features to the radio including a Keypad Style Frequency Entry (use the mouse to hit the buttons - I don't know if the keypad actually enters the frequency or not - I'll try this and a lot of other tests and post the results). Another nice feature is a Slider Control to move rapidly through the enter Frequency Range or simply from one part of a band to another. There are lots of memory features but it does not read or write to the FT-100 Memory Blocks. As I understand it that is a function of the firmware in the FT-100. Computer control for this radio is real nice and this program does a good job. There is a free trial download on the web.

TRX-Manager also interfaces as an ActiveX component to a logging program called Logic5. This fully integrates logging with Computer Control. Logic5 also has a Radio Control Interface but nothing like TRX-Manager. Logic5 info is at www.hosenose.com.

I will post test results on both of these programs within the next few days

2586. CAT Interface, TRX, Logic 5, DX4Win

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-10 18:57:14 UTC
From: Michael Jones
Topic: 2586 Message: 2586

TRX manger is a well made program, but I personally couldn't find a use for it. I suppose it makes a few things easier on the compact FT-100 (which is in the car anyway) but for the FT-920 and FT-847 in my shack, I couldn't quite figure out what I would need it for. Its far easier to operate the rig itself then it is to operate the software. I've played with it off and on ever since it was called FT-Manager. I'm a great advocate of computer logging, it saves a ton of time. I also realy like the ability to see past information about stations I've worked in the past. Unfortunately, the log built in to TRX doesn't allow me to track States or Counties or Prefixes or Zones or even Continents. Logic 5...now I'll get out the torch. I commend them on using the interface to TRX. I even commend them on many of their features. But the facts remain that it is 1: a Windows Resource Pig i.e. don't plan on doing much else at the same time. 2: It is slower the molasses i.e. try an import or an export on a 6000+ QSO database...you better hope you like watching the grass grow. Then, to top it all off, you better hope it doesn't crash. Believe me, it will...on a regular basis. I'm a programmer for a living...its obvious that Logic 5 cannot handle even mediumn amounts of data. Now, there is a program that I highly reccomend for all of the above. DX4Win, by KK4HD available in Demo form at http://www.erols.com/pvander. This is a well made, stable, intuitive, fast program. It features everything under the sun that you need. Including DX cluster support, awards tracking, Label making (though I would like to see an enhancement for automated address labels from either QRZ or an FCC file) I have 0 (zero) affiliation with him or his product, I'm simply endorsing it. If your interested in using CAT capabilities, I suggest you check it out. Mike KF6SWI p.s. this wasn't a flame against anyone elses opinions, I'm simply stating mine. ----- Original Message ----- From: "Rich Bay" To: Sent: Thursday, February 10, 2000 10:07 AM Subject: [FT100] CAT Interface > From: "Rich Bay" > > Yesterday I received the CAT Interface Cable. > > I am controlling the FT-100 with a real neat little program called > TRX-Manager. 2587. YSK-100 Why am I missing parts?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-10 20:44:30 UTC
From: Gary Mitchelson
Topic: 2587 Message: 2587

In my new YSK-100 seperation kit it was missing 4 critical and oddball size screws [M2.6 x 7B (Qty 2) and M2.6 x 12B (Qty 2)]. These are the ones for securing the cable to the radio and faceplate.

I contacted HRO and they were very kind in sending out the hardware pack from another YSK-100. Guess what? That was missing the M2.6 screws also.

What's up with Yaesu these days?

Anyone know where I can get screws this size?

Thanks for the alternative view. I will certainly take a look at DX4Win.

I also do a bit of programming and find a FoxPro based data source (i.e. Logic5) to be quite usable. I recently have done more work with SQL Server and Access Databases using a VB6 Front End but I still find the Foxpro stuff to very functional.

I have not seen a problem with resources when using Logic5. I have it interfaced with the Flying Horse Callbook CD and regulary use it with DX Spots. I only have a few thousand entries in my log but with clean indexes it runs pretty fast.

I find most all the radio's and programs out there to be more or less "miracles". I also enjoy opinions from other users.

I have no affiliation with either Logic 5 or TRX Manager and am only giving my opinions.

The ability to key the transmitter and put out say, 5-20 watts, would let us use an automatic antenna tuner (something i AM INTERESTED IN DOING). 73, dICK, w1ksz -----Original Message----- From: John Hansen [SMTP:john@...] Sent: Wednesday, February 09, 2000 8:33 PM To: FT100@onelist.com Subject: [FT100] Is an FT-100 Keypad worth doing? From: John Hansen I am interested in the opinions of FT-100 owners on the following: I have been working on creating a direct frequency entry keypad for the FT-100. I've basically finished it, but it has yet to be tested. I've found that the number of things you can do through the computer port on the FT100 is relatively limited compared even to other Yaesu radios. The keypad that I did for the IC-706, for example, also had the capability to switch between VFOs, turn split on and off, and directly access memories by number (e.g., push M45 and it went to memory number 45). While it is possible to switch VFOs and turn the split on and off on the FT-100, it appears that there is no way to access the memories via the computer port. This strikes me as amazing on a radio that has so many memories, but it apparently is true. So here's the question. Is there any interest in a direct frequency entry keypad kit for this radio if it does not have the capability to access the memories? If so, would having any of the following features available on the keypad be useful, and, if so, which ones are the highest priority? - Ability to key and unkey the transmitter. - Ability to toggle the repeater shift between +, -, and simplex. - Ability to select filters. - Ability to set the CTCSS tone These items do seem to be possible via the computer port, even though direct memory access is not. I bought the ATAS-100 last week from Austin Amateur Radio Supply and the separation kit today. The ATAS-100 had a one page instruction sheet and the set screw was in a small plastic bag with a small allen wrench. The antenna was wrapped in a plastic bag. The separation kit had all the little screws in it in 2 separate bags and one page sheet of instructions. The radio was a 9I with no stickers on the outside of the box. So far everything works well. The only problem I had was when I went to 15 meters the antenna would tune up fine. Then half way through my QSO's it would give me the high SXR icon. I fixed it my mounting it with a better ground and now it works just fine on all bands. Today I also installed the world's smallest mobile packet station. A Hewlett Packard 200LX palmtop computer hooked up to a PacComm Handy Packet TNC and a Kenwood TH-78 dualband talky. Now when I drive in Austin Texas, I can stay connected to the DX Packet Cluster. Life is good. I'll put up some pictures soon. In reading the manual and testing the FT-100 via a computer, I don't believe that either keying the transmitter or changing the output power are available functions using the CAT interface. Sorry to add to the list of disappointments.

CORRECTION: It is possible to key the FT-100 via the CAT interface using the PTT=on/off command. Sorry for the mistake--I haven't tried that yet, but it is documented. Changing the power output setting via CAT is not one of the available commands, however. This is something I hoped to do since I do a lot of QRP work and dislike having to enter the menus, find the HF power setting, and screw the knob from 100 to "0" (=2.5 watts).

2596. Microprocessor Upgrade?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-11 16:39:38 UTC
From: aschach3@csc.com
Topic: 2596 Message: 2596

Hello all,

I love my FT-100 and ATAS-100 but occasionally bump into some of the seemingly arbitrary limitations of the rig (i.e. not being able to program the memories via the CAT interface). I was wondering if would be worthwhile trying to impress on Yaesu the advantage of being able to deploy a microprocessor upgrade so that we could get the additional features without having to buy a new rig? If not Yaesu, then how about an after-market supplier?

It makes good business sense for Yaesu since they could sell periodic new releases of the rig's firmware and continue to make money on a rig that has already been sold. Let's face it, most of us only buy a new $1000+ rig every few years but the very good suggestions for features we see here on the list come rather frequently.

73,
Abe Schachter N3BBF

Another Vote For the ATAS-100
Mine has been mounted on a 96 4x4 Chev 3/4 ton pickup since September 99.
Since I'm a Game Warden in the Backcountry of IDAHO the ATAS-100 and the
FT-100 see some darned rough service. The Antenna works well in almost every
imaginable environmental condition. Including severe COLD!!! And 4x4 roads
and off roads....
Keep in mind how important a GOOD Ground is!!!!!
Also, I use a seperate Diamond VHF/UHF antenna.
Only wish for 75 meters coverage.
GARY

2601. ATAS100 /RF exposure

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-12 05:36:10 UTC
From: Lee810@aol.com
Topic: 2601 Message: 2601

A few weeks ago I posted a link showing a picture of my ATAS mounted on the hood of my Durango. One of the responses I got was the following:

>Have you considered the RF given off the antenna at that location and
>your being only a couple feet away from a 100 watt signal?
>I do not think that would meet the FCC requirment for safety.
>
>Sorry..

I posted a follow-up message that I would do the measurements just to make sure. Today, using a Haladay HI3004 RF field strength meter, along with a friend who is an RF expert, we measured the field strength from of the ATAS100 in and around the vehicle. Here are the results when running a 100W FM signal as measured in the front seat near the driver's head:

10M ~ 8 V/m
12M ~ 20 V/m
15M ~ 15 V/m
17M ~ 15 V/m
20M ~ 12 V/m
40M ~ 16 V/m

Outside vehicle, the field strength was about 30V/m when measured 2M horizontally from the antenna.

The FM signal was about 2x the strength of a typical SSB signal since it puts out 100W at 100% duty cycle whereas SSB was about half of that. So the readings above are about 2x higher than you would expect in normal HF operation.

The maximum exposure limit for a controlled environment is 61.4 V/m at 30-300Mhz and it rises as the frequency decreases according to the equation 1842/f. For an uncontrolled exposure, the 30-300Mhz limit is 27.5 V/m and increases according to the equation 824/f where f is in Mhz as the frequency decreases.

You can see from the readings that the fields inside the vehicle are well below the maximum allowable for a controlled environment such as a ham station, and even meet the more stringent limits for an uncontrolled environment. Combine that with the fact that the measurements were taken at 100W with 100% duty cycle, and you can see that this antenna arrangement is considered to be safe by FCC standards.

2604. FT-100's S-meter...

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-12 13:23:13 UTC
From: N1evh@aol.com
Topic: 2604 Message: 2604

Is there anyway to adjust the S-meter on the FT-100??? My S-meter
seems to be displaying signals signals weaker than what I am receiving.

I have a 2m repeater that is located about 3/4 of a mile from me.
When I receive it on my FT-100, it is only reading as a +20dB signal.
On all of my other radios (FT-290R II, VX-5R, FT-50, etc), I am
getting a full-scale signal.

One would think that a repeater running 50 watts just 3/4 of a mile
away would register a stronger signal than +20dB.

Mike:
Don't adjust it! That meter is probably more correct that you are used to. The problem with most FM radios is that they don't actually read signal level and will max out the meter with much less signal. The FT-100 reads actual db above S9.
Using Yaesu's reference for S9 of 20 dBu (10 uv), an S9+60db would be 10,000 uv or .01 Volts! It's unlikely that you're getting anything like that from a 50 Watt repeater 3/4 mile away, particularly if at that distance you're significantly below the main lobe.
I'll leave it for someone else to do the field strength math with assumed values of ERP and receive antenna gain, but I would think the +20 signal (100 uv) is reasonable. If you're concerned, ask someone with a calibrated signal generator to check both radios. I'll bet the FT-100 will pretty much track relative increases in signal and the other radio won't.

Date: 2000-02-12 21:38:35 UTC
From: sammy89@hotmail.com
Topic: 2608 Message: 2608

I was interested if there is a more narrow SSB filter you can replace the standard one with. It is very small and I have checked with INRAD (Inernational Radio Crystal Filter COmpany). I was thinking there may be a more narrow one made by MURATA or KIWI etc. I wish Yaesu gave you the Option to pup a better SSB filter in the radio . i would skip the CW Filter and put the Better SSB , and AM filter in. Perhaps a software mod. Hey...If there is a 8 MHZ filter that would be the same size as the AM and CW Filter perhaps you could select it in SSB mode ??

I doubt the ATAS-100 sends ANY commands to the FT-100; all control is surely from the radio. The radio may send low power signals to the antenna and adjust it according to the return SWR, but that is different from the changing the FT-100's power setting externally.

Also note that the ATAS-100 and a CAT connection to a computer cannot be used simultaneously, as both require use of the single CAT port. TRX-Manager's documentation makes a point of this.

Wow. My installer lost the aforementioned screws. After a dozen local inquiries I found 25mm(!) long 2.6mm screws and I fashioned a huge washer. But when I sent the radio in for some minor repairs I asked Yaesu and they supplied for free some replacements.

Gee, I just don't see why they didn't use a snap connector arrangement on the connection at the radio.

I think what your seeing is a better representation of what is really going on. I am not saying the S-meter is accurate across the entire range but, I think it is much better then the run of the mill junk in most 2 meter fm only rigs. Yaesu or anyone else would have to spend more money on making a accurate S-meter across the whole scale. Then the price of the rig would go up. I think a lot of hams are happier seeing a "59+" on the rx. Then next thing you know we will be asking for NB's on the 6 meter FM instead of accepting the cop out they put in there manuals on why you don't need a NB on 6 meter FM. Tell that to Motorola. I have to use commercial gear on six FM in my vehicle for the NB to get rid of the ignition noise. But thats a whole story for another time. 73, Dan ----- Original Message ----- From: To: Sent: Saturday, February 12, 2000 5:23 AM Subject: [FT100] FT-100's S-meter... > From: N1evh@... > > Is there anyway to adjust the S-meter on the FT-100??? Hi all,

I have almost the same problem.
In the beginning the S meter was working alright but not anymore.

The max scale is 9 meanwile it can goes up to 9+60. Also often it's more a modulation meter then a S meter.
It goes up & down. I test with 100 watt and realy the S meter goes not higher.

Could this be solved?

Me too - I'm surprised that more people haven't complained about this!
Although I've got the Remote Kit, I find myself not using it because of
this arrangement, and the risk of losing the screws. The IC-706
introduced this idea - you'd have thought that Yaesu would have
learned!

I like the idea of the screws. The more screws the better. The more screws, the harder it is to steal and the longer it takes to steal. The only reason I got the remote kit is so that the radio looks harder to steal. They might get the front of the radio, but if they want to steal the rest of it, they will have to remove the front seat. Tim, I think you may have mistyped below. The atas 100 does not use the cat port on the ft-100. The atas 100 connects directly to the hf coax antenna output of the ft-100. It does not connect to any other portion of the ft-100. Perhaps you were referring to the amplifier? William -----Original Message----- From: Timothy H. Heaton [mailto:theaton@...] Sent: February 12, 2000 3:10 PM To: FT100@onelist.com Subject: Re: [FT100] Is an FT-100 Keypad worth doing? From: "Timothy H. Heaton" > From: "Richard W. Solomon" > > If so, then how does the FT-100/FC-20 combo work ?? > > 73, Dick, W1KSZ I doubt the ATAS-100 sends ANY commands to the FT-100; all control is surely from the radio. The radio may send low power signals to the antenna and adjust it according to the return SWR, but that is different from the changing the FT-100's power setting externally. Also note that the ATAS-100 and a CAT connection to a computer cannot be used simultaneously, as both require use of the single CAT port. TRX- Manager's documentation makes a point of this. >> In reading the manual and testing the FT-100 via a computer, I don't >> believe that either keying the transmitter or changing the output power >> are available functions using the CAT interface. Sorry to add to the >> list of disappointments. >> >> -Tim (WB7NMY) who still loves his FT-100! Please note my earlier correction that you CAN key the FT-100 via CAT input, but you can't change the power setting. -Tim (WB7NMY) ---------- ONElist Sponsor ---------- GET A NEXTCARD VISA, in 30 seconds. Ralph,

Have you ever checked whether you can get the front panel without the rest of the rig? I read a while back on one of the lists I'm on that it's impossible get the front panel by itself.

Go into the alignment menu by pushing A,B and C at the same time and turning the FT-100 on. Then again push and hold FUNC. When turning the Select knob beyond the usual menus, you will find menus F01 thru F59. F07 is for S-meter full scale. Alignment: Inject a 14.200 MHz in USB mode into the antenna at +95dbmicroVolt. Adjust F07 to S9+60dB. Exit the alignment menu push FUNC. My S-meter > seems to be displaying signals signals weaker than what I am receiving. Hi all, I have almost the same problem. In the beginning the S meter was working alright but not anymore. The max scale is 9 meanwile it can goes up to 9+60. Also often it's more a modulation meter then a S meter. It goes up & down. I test with 100 watt and realy the S meter goes not higher. Could this be solved? Marcus pd2db Netherlands

I know I said I wouldn't but...

I have an FT100 for sale with the remote seperation kit. I do not want to take too much bandwidth here, but it is in great shape. I only removed it from my vehicle because I wanted an APRS mobile rig. If you are interested, the price is $1000 with the seperation kit. You have to pay shipping and insurance (20-30?) from Utah to you.

Email me direct for more information.

Thanks,

Tom NY4I
Sandy, Utah

My son had the front of his stereo stolen out of his car and he just ordered another one with no problem. I am sure if you scream enough at Yaesu they will sell you another one. I don't see why the wouldn't, especially if you have a receipt. If anybody gets their faceplate stolen and Yaesu wont give you another one here is what you do. Order a new radio and remote mounting kit from HRO. Make sure they give you one of those 9D refurbished ones with all the stickers on the outside of the box. Install the new face plate on your old radio. Then call Yaesu and tell them that not only are the screws missing from the remote kit, but the front of the radio is missing too! They must have forgot to put in the face plate and the screws when they sold you a refurbished radio. Send them the radio back and get your money back.

I've got the LDG tuner and it's working fine. I'm in the process (just broke away from some soldering to recheck mail...) to add mods to allow me to remote mount a front panel for the LDG unit. HOWEVER, I also want to do some playing with the FT100 to find out what it takes to get a "Tune" signal out of the FT100. I THINK that the FT100 will send a +9v or +12v DC voltage through the antenna lead (use a choke and cap for filter) and use that signal to drive a relay, to do a "manual tune" of the LDG AT-11. That means that with a simple filter and a relay in the AT-11, the FT100 can initiate a TUNE function. I'll try it one of these days this week. Mikef ----- Original Message ----- From: Richard W. Mike:
Set your AM mode to 10 W and use that to tune. It's pretty easy to hit
the mode button a couple times, transmit for a second, then the mode
button a couple times. That works pretty good with my SGC tuner and I
believe the LDG will tune just as fast.
I tried playing with some of the FT100 tuner modes but finally gave up
due to the limitations and hassle in comparison with the above procedure.

From: Steve Jepsen
Topic: 2630 Message: 2630

(I realize that the follow paragraph is obvious, but some readers seem to have missed it)
Since the front panel is easily removable (unless you're in a hurry) and the rest of the rig is likely to be screwed down. It follows that when you leave your car on the street overnight, you will probably remove the front panel and leave the body of the rig in the car. If a thief breaks into your car, he'll get the body of the rig and you'll have the front panel. So long as Yaesu won't sell the front panel, the thief doesn't profit. (If they report all attempts to buy a front panel to the police they might even help catch a few thieves)

I would think that we, as FT100 owners, should insist that Yaesu refuse to sell FT100 front panels.

Steve -AI7W-

Okay. I don't own the ATAS-100, so I don't know about the physical connections. I have read several documents claiming that the ATAS-100 and the CAT port cannot be used at the same time, and I just assumed that it because of common wiring. Thanks for the correction.

If my radio ever gets stolen I would just simply call my insurance agent and they should cover it. Or the ARRL will cover it through their insurance plan. I was just making fun of the fact that some people think that they are getting refurbished radios from Yaesu because of the old serial numbers and the stickers on the box. I installed my radio underneath the seat. I had to remove the seat to do it. If a thief goes to all the trouble to take off the seat to steal the radio before I get back to my truck, he could have the radio. If the front of my radio ever gets stolen, I would not order another from HRO. I would just follow you around and wait until you park your vehicle. Then I would just simply bust out your window and steal the front of your radio and my problems will be over. THAT WAS A JOKE!! GET IT? Mikef >>

My big thumb hit the send button..Sorry!!
LDG makes a new version available with a remote mount head, its called the
MD11. This solves the problem of tuning the AT11 from another location. If
you are a "good ham", you can install an earphone jack and add a remote
button to tune the AT11 from up front and avoid the addtional purchase cost
of the MD11. I would still rather have the AT11 or MD11 over the FC20.
To clarify things, the FC20 uses the data line which then precludes the
use of the data line for cat functions. The ATAS does not require the data
line for any purpose whatsoever. The ATAS uses a circuit which determines
motor direction by how much voltage is sent up the coax. If its 9 volts it
goes one way, if its 12 it goes the other (circuitry is located in the
antenna).
The radio "watches" the SWR to find a match and no info is sent to the
antenna nor sent back during this process. The radio requires no connection
to the CAT port for this to occur. The FC20 will tie up the cat port and also
"suck" in actually doing the job of matching the antenna to the radio. Dont
get me wrong, they work but for 250 plus it should be better. Its matching
range is limited and will often fail in finding a match for a non resonant
antenna. Its good for tweaking an antenna thats a band or two away but forget
trying to tune an antron on 17m as it most likely wont do it...
Lets all be honest here, I am hearing quite a bit of discomfort with the
FT100 over its true purpose (a small do all radio). I enjoy the radio very
much and do agree it could be better but its merits far outweigh its faults.
I am working quite a few countries every day from the car with excellent
reports, I use the radio as an FM rx and listen to local talk radio inbetween
lulls in band activity. When the bands I use are closed I often jump onto 2m
ssb and chat with my friends using a vertical. I also jump on the 2m/440

machines to see whats happening, for ease of use this radio is great, all bands in a box, the other stuff is trivial.. Good Luck.. Richy

Hello

I have a FT100 from the 9e series with several mod stickers for what thats worth. The radio has always been well grounded but always has RF problems. This results in uneven output and crappy audio. It even changs bands at times just by keying the mike. Has anyone run into this kind of problems and how did you solve it? I have several radios both mobile and base living happily where I tried to use the FT100. What gives with this radio? What makes it so sensitive?
Thanks Ralph k5mog

Topic: 2638 Message: 2638

I ordered a LDG AT-11 today.I was impressed by the knowledge the person I talked with. I was also told that if within the 30 days after I received the tuner I wanted to upgrade to the AT-11MP I would be given full credit for the AT-11 minus the shipping. This is a real good deal! I am using a FC-20 right now and am really unimpressed. I also tried a MFJ-948 and was exceptionally disappointed. I'm using 300 foot long wires and a dipole as the antennas. I've already done a dejanews and onelist search, but Im looking for any and all comments regarding this tuner. Also if anyone is interested, I will be doing a performance study of my new FT100, s/n 9F04xxxx and will create a word document of the results. Please email me your address if you are interested. I use a IFR 1200S for the testing.

What makes it so sensitive? > Thanks Ralph k5mog Sounds like you still don't have a good enough ground. Have you tryed the FT-100 in your house as a base unit with a good ground? If it works in your house but not in your car then it is probably not grounded good enough in your car. You may want to invest in the seperation kit and mount the radio underneath your seat. Run a 3 inch ground wire made from and old piece of braid from old coax from the side of the radio straight to the floor board. Scrape the paint off first to bare metal. That should fix half your ground problems. That is the easy part. The hard part will be finding a good ground for the antenna. Guys: You should note that this is not the case for many of us running mobile FT-100 installations. Anyone who is having this problem either has a significant problem with the radio or something about the installation that is causing the problem. The keys to a successful mobile installation are good power and good antenna installation. Personally, I think a proper antenna installation is the most important. The most critical factor in that regard is ensuring that the coax is not acting as a return for RF energy. That means a good ground to some significant metalwork at the antenna and perhaps decoupling of the transmission line in some cases. Unfortunatly, some vehicles now have metal panels, bumpers, etc that are not electically connected to the rest of the vehicle. If you mount your antenna in such a location, you WILL have problems. I'm not saying that this is the case for those who are having problems. It's entirely possible that there is something wrong with those radios that's allowing RF into the unit or some other problem. What I am saying is that many FT-100's are known to function fine in mobile installations and in my opinion it's a much better mobile radio than anything else currently on the market. From: Bill Tubbs
Topic: 2643 Message: 2643

I finally figured out what's going on with the ATAS antennas. Those few bad ones we keep hearing about somehow got the screw mechanism from the MD80 series aircraft stabilizers!

MIne's perfectly fine, however, so it must have been from a different aircraft... ;-)

Hello

Anybody out there know how to remove the block for tuning the atas100 on
80 and 160. I have copyed the control circuit out of the atas100 and adopted
it to my bandhopper. So far all I've accomplished is having an ant that is
not limited to 100 watts. (the bandhopper is kilowatt rated)
I am unable to have the radio (FT100) tune these bands for me due to the software
block on 80 and 160. An e-mail to yaesu was no help. They say it can't be done
Are there any hackers out there smarter then yaesu. You would be my buddy for
life. Anybody that can solve this I will share my antenna controls with you

Stands for Screwdriver Antenna Memory. It doesn't tune your screwdriver automatically, but what it does is remembers where you previously tuned the screwdriver in each band. Then you put your radio on say 20 meters and put the SAM on memory 5 (for exsample) and it will screw the antenna for where you had it tuned up in that band. Not as good as auto tuning your antenna, but it is the next best thing. Cost is around $150.00. 2647. New to this Ft100 list

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-16 02:46:57 UTC
From: george-norma
Topic: 2647 Message: 2647

Name here is George N7INC

Had my FT100 since last April when they first came out.
No problems with the rig, but had to send the separation cable back and get another one that worked.
I do have the ATAS-100 antenna mounted on a 1995 ford pickup.
I just found out tonight that the Ft100 does not store the repeater offset in memory, but is what ever is in menu #42. rats.
Also would like to tx on 47.5mhz that our SAR unit uses.
Good to read some information from you guys about the FT-100.

Thanks,
George

2648. FT-100 Successful AO-10 Mobile Satellite Contacts !!!

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-16 07:49:18 UTC
From: k7xq@aol.com
Topic: 2648 Message: 2648

Just a note on using the FT-100 in the mobile working satellites.
Tonight, i successfully worked W6VPH and KB8VAO on the AO-10
Satellite using the FT-100 barefoot on my way home from work at
1930 utc. The antennas were both single M2 HO-loops mounted on the same
mag mount mast. I used a antenna switch to switch between the two antennas as
I Xmit and RCV. I had to estimate the uplink frequency based on previous
experience with this satellite. The uplink was only 20 watts, i used NO
external preamps. My location at the time of the contacts was livermore california
on interstate 580. I just wanted to share this information for those wondering
about the capabilities of this radio. It was slightly " challenging " as this radio
only can do half duplex / split but it can be done !!!

From: k4hr@erols.com
Topic: 2651 Message: 2651

Anyone using this combo, and if so how well does it work? Have been using the FT-100 along with ATAS-100 and works well. However, switched over to the SG-237 and whip, and find I'm unable to keep the combo in tune. High SWR display keeps coming on and requires retuning of SG-237. Also, seems like SG-237 fails to store setting in memory, as major retuning is required when changing bands. Have good bond between truck body, tuner and ant. ball mount. Also, using very short feed between tuner and ant. Rig is production run "9H".

Im About to buy one (FT-100). We have a hamfest in a week. biggest hamfest in the southern hemisphere. The hamfest price is going to be better. prices are going to be 5%-10% better (only 8 sleeps, its just like christmas) and was at the australian distrubitor today and was having a look at their demo unit. I wanted to make sure it could do one or two things I required (split frequency's for sat's and the use of the repeater function. For $2800 aus i wanted to make sure it was going to do the job. Its repleacing a FT-8100R that gave me flawless performance.

The radio i was looking at was a 9d02???? (something). The box had 4 little stickers. green, blue black and gold (from memory).

Is this the most recent batch, from people who have got one in the last month (i guess it takes time for them to get to australia) I guess all of the ones this company sells will be this model range (9d?????).

One last question. We dont have access to the ATAS-100. Its not imported and obtaining it will require an international order through HRO or similar. How well does the FC-20 perfrom. Has anyone used this in a Vechicle?. SCG autotuners are rather expensive and im not sure if i want to keep changing bands on a outbacker antenna if i brought one of these (most mobile operation on the HF side of the radio will be on 6m) But i would like to tune to 10m FM easily. Other option is a MFJ versa tuner or similar but this two has limitations. (mobile operation is a bit dicey).

Thanks

Sounds like you got RF Feeding back into the rig. Same issue here only
different set up. Have increased coax length and added ferrite bead to it.
Seems to have done the trick. The SWR detector in the FT100 is very sensitive
to RF feedback. I have had this problem for about 4 months now. Finally got a
handle on it. Good luck with the antenna. Using outbacker here. I have heard
the best mobile signals from screwdrivers. No complaints on the outbacker as
I have worked everything I can hear, but that little SWR icon issue plagued
me for some time.

Andrew...The FT 100 is a great radio. Keep in mind it does not do duplex
operation and it is capable of Satellite stuff although rather cumbersome.
Get in contact with Lee, K0LEE at Lee810@... and he may have more info
for you. The serials here are up to H and I now. The dots on the box are mods
to the original radio. Yaesu has been great on fixing bugs, but you must wait
your turn if it needs to go back for repair. Usually 2-3 weeks at the shop if
needed. Mine has been there 4 times, but is really a great package. I am very
happy even with the little issues I had. No radio even close to it. Good
Luck!!

Lew: The other person who responded could be right about RF getting back into the radio. Make sure you really have that tuner grounded to something significant with a short copper strap or something similar. I've been running a similar configuration in my truck for a while now. I stopped using the matching SGC whip because I was tearing ip up pretty bad running through the trees on the seasonal roads up here. I'm currently using a 102" CB whip and can tune everything but 160 with no problem. I do however notice that at times it either doesn't want to tune or seems to change and need to be retuned. I don't have controls for the tuner installed yet, but I suspect that will let me force a retune and such when necessary. One thing to keep in mind is that the antenna can be pretty sensitive to things in it's near field. If you pull up near a building or under a line or something it may very well affect the tuning. Also, if the antenna bends much while driving, that can also affect your tuning. Using the stainless steel whip I notice that I do have to retune sometimes when I get up to highway speeds. It is however a nice combination and most of the time it retunes to a frequency in a fraction of a second. I use the AM mode with a low output setting to get it to tune since, despite what they say, I don't think it retunes real well with a speach signal. You can however do a short whistle on SSB to get it tuned back in. Chuck - N8DNX On 18 Feb 2000 k4hr@... wrote: > From: k4hr@... > > Anyone using this combo, and if so how well does it work? 2657. ATAS-100 will not manually tune.

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-19 17:31:28 UTC
From: Gary Mitchelson
Topic: 2657 Message: 2657

I just installed by brand new ATAS-100 to go with my new FT-100 (although it is a 9D sn).
I have it on a thru-roof mount with a good ground. It will auto-tune fine on all bands but I can not get it to manually tune (or retract) by how the book says to do it on page 63 (PTT and use UP or DOWN key on mic).

As I mentioned this is a brand new FT-100 but with a 9D sn, the back of the mic says 9G***
Any thoughts?

----- Original Message ----- From: Andrew Scott To: Sent: Saturday, February 19, 2000 4:10 AM Subject: [FT100] Serial numbers?.. I think you will be alright with the 9D serial number if it has the stickers on the box. I think those are radios that Yaesu did the mods on so you are probably safe. I got the dreaded X swr Icon on 10 meters with a well grounded ATAS-100 antenna. When I hooked up my Bird watt meter between the radio and the antenna, I didn't get the X swr icon. I think because by adding the Bird watt meter I also had to use 2 extra feet of coax. So I unhooked the Bird and just added the extra 2 foot piece of coax to my old coax and the Atas-100 tunes up just fine now. If I remove the extra piece of coax, I get the old problem back. Go figure. Ralph AA5YC/M > From: "Andrew Scott" > > Im About to buy one (FT-100). We have a hamfest in a week. biggest hamfest > in the southern hemisphere. I use my FT-100 with a Hustler Mobile Antenna, 20/17/15/12 mtr coils on top. The mast also doubles as a 6 mtr antenna. Works fine for me, even at 65+ mph on the highway. I drive a Chevy CK-1500 Pick-Up Truck. The VHF/UHF antenna is a duo-band Larsen. No screwdrivers, no tuners, no sweat !! 73, Dick, W1KSZ -----Original Message----- From: Andrew Scott [SMTP:vk2two@...] Sent: Saturday, February 19, 2000 5:10 AM To: ft100@onelist.com Subject: [FT100] Serial numbers?.. From: "Andrew Scott" Im About to buy one (FT-100). We have a hamfest in a week. biggest hamfest in the southern hemisphere. The hamfest price is going to be better. prices are going to be 5%-10% better (only 8 sleeps, its just like christmas) and was at the australian distrubitor today and was having a look at their demo unit. I wanted to make sure it could do one or two things I required (split frequency's for sat's and the use of the repeater function. For $2800 aus i wanted to make sure it was going to do the job. Its repleacing a FT-8100R that gave me flawless performance. The radio i was looking at was a 9d02???? (something). The box had 4 little stickers. green, blue black and gold (from memory). Is this the most recent batch, from people who have got one in the last month (i guess it takes time for them to get to australia) I guess all of the ones this company sells will be this model range (9d?????). One last question. We dont have access to the ATAS-100. Its not imported and obtaining it will require an international order through HRO or similar. How well does the FC-20 perfrom. Has anyone used this in a Vechicle?. SCG autotuners are rather expensive and im not sure if i want to keep changing bands on a outbacker antenna if i brought one of these (most mobile operation on the HF side of the radio will be on 6m) But i would like to tune to 10m FM easily. Other option is a MFJ versa tuner or similar but this two has limitations. (mobile operation is a bit dicey). You are probably using the wrong buttons. I had the same problem. Don't use the buttons on top of the mic. Use the buttons on the front of the mic and it will work then. Or you can use the up and down buttons on the front of the radio. The manual was not to clear on this.

2662. FT100 failure !

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-20 03:01:33 UTC
From: ka2ykc@aol.com
Topic: 2662 Message: 2662

Hello all,

Well, I thought I was one of the lucky ones with a 9E serial number FT100. I had it sitting on the desk here in the shack for a few months, only using is a few times when I was bored with the regular station equipment. Finally got the new car and installed the FT100 in it yesterday. The unit is wired directly to the battery, with additional chassis grounding, and the HF antenna is a 10m Wilson5000 hole-mounted on the roof. SWR is flat, and all was working fine this morning, with a few contacts into Europe. This evening, while attempting to work a JA station, after a few unanswered calls, I noticed I lost output power. I also noticed that the SWR icon intermittently appeared a few times (when radio was cold) earlier in the day, although my inline meter showed no swr problems.

Tests reveal no output on all bands 1.8-60MHz, with the exception of a slight meter movement on AM mode, but still good power output on 2m and 70cm.

By now, I know a bunch of you (me included now) unfortunate souls have had your FT100's back to Yaesu (more than once sometimes, I've heard!). I am curious as to the failures found when the above symptoms were reported. Also, what is the turnaround time for the warranty FT100's ?

Thanks for your time.
73 Eric
KK2ED (ex KA2YKC)

(If this thing goes back more than once, I am getting on the phone to Visa and raising hell from the top downwards. What the hell, the c.c. companies brag about their "buyer's assurance" when they push their cards on you, maybe it's time to take
them up on this service.)

2663. Finally, a... Re: FT100 failure !

<snip>

You know... maybe it's me, but this is the first FT-100 "failure" I've read about in a L-O-N-G time. After all, I was one of the "real" unfortunate souls that sent an early FT-100 back twice. Yaesu did OK by me, they fixed it and it's worked flawlessly in daily use since July of 1999. The turn-around time in each case was about 10 working days. It's a hell of a wait, regardless.

I actually plan on sending it in a third time, under warranty, to have any "updates" installed that MAY have come out. This worked well for me with my FT-847 as I got the new CPU, new fans, and some other things I don't even know what they fixed :-)

So, take a tip from a seasoned FT-100 owner, quit worrying about if the rig is "safe to buy" and what serial number you got. It's unfortunate, but inevitable, that someone is going to blow a final like our friend may have done above. By the way, those colored stickers (in my experiance) are simply inventory destination tags. My FT-100 box has two stickers on it and it was one of those early "defective" units - it had no patches installed :-)

If you really want to think about something, thing about what Kenwood has up their sleave for all the soon to be General-lites and Extra-lites... the Kenwood version of the FT-100/IC-706MkIIG... the TS-2000 (or whatever they are going to call it). SHHHHHhhhhhhhh!

From: Larry Bedard
Topic: 2664 Message: 2664

Hi ALL,

I've owned my FT-100 and ATAS for about 8Mos. now and it proves to be a fine little rig. Lately I had been getting the Ant-err display so I looked over the feedline and found a problem with the coax (small teflon coax)near the input to the antenna mount. I cut off the bad portion about 6" and resoldered the connections (very well I might add),but now the ATAS will not move. I tested the connections all fine there is NO ant-err now but it will not tune. What should I be looking for?

Thanks N1HMT Larry Bedard

I recently downloaded Rainer's files from the Onelist files section and with Rainer's permission, put them on a web page for easier viewing. As some of you had noticed, these .jpg files would not display properly in a browser from the files section. You can see them at:

http://members.aol.com/tdev/sm5lbr.html

Rainer was also going to translate the CQ-DL article he wrote into English and perhaps I will add it to that page when it is available.

Disconnect your coax from the antenna. Then with an ohm meter check between the center connection on the ATAS-100 and the chrome base of the antenna. If you don't have about 28 ohms, then the antenna is broken and will need to go back to Yaesu. If you have 28 ohms then make sure you have the ATAS option turned on on the radio menu. My Antenna is broken right now. It doesn't have 28 ohms on the coax connector and I am awaiting a replacement from my local candy store. If I hold the antenna straight up it is open, but if I pull on the antenna and make it lean back, I get 28 ohms and the antenna works just fine. I am still able to use my ATAS-100 by leaning the antenna back and holding it there with a rope. It looks weird, but at least it still works until my new antenna gets here. I guess it must have a loose connection inside of it. I bought it about a week ago and it worked great for about 5 days, then it started to act weird. It would take forever to tune up sometimes. Then it would only tune up while I was moving down the road fast. That is when I checked it with an ohm meter and noticed that it would only work when I pulled on it and leaned it back. Hope this helps.

I really liked the idea of using a couple clamps to hold the antenna when stowed away. I have a Ram 1500 Quad Cab and I usually just throw it in the back. Now, thanks to you I have a new project to add to the list. I'm going to put a couple of the same style clamps under the rear seat. Thanks for a great idea.

Hi Larry, also check for 0 ohms from the base to the whip,as this is a DC grounded antenna...
I had one that went open between the bottom (chrome base) and the next chrome ring, this = no more tuning...this part is the matching section of the antenna, unfortunately I don't know how to dissemble this part with out damaging it since it is secured with pins...

2670. FT100 FAQ

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-21 03:22:40 UTC
From: lee810@aol.com
Topic: 2670 Message: 2670

I posted a message a few weeks ago about soliciting information for a FAQ which resulted in a single response. With 530 members on this list, I thought the response for a FAQ would be a little more enthusiastic. Well, I DID say it was a thankless job. Perhaps that scared everyone away because they thought I'd ask them to volunteer :-). I've decided to go ahead anyway and would encourage any of you who would like to write sections for it (or make suggestions) to send them to me. The FAQ is just getting started so it's a little sparse for now, but as material gets submitted, it will grow. I've been following the development of the FT847 FAQ and it is one of the nicest I've seen so that will be the standard I will attempt to emulate.

You can find it at:

Hi Cliff, that is exactly what happened to mine also. Mine is also open from the bottom to the first chrome ring to the base so there is not 28 ohms when you check it at the coax connector. It only works when I lean it back. I could not figure out how to take that bottom piece apart. If anybody knows let us know.

2673. ATAS Problem

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-21 18:52:59 UTC
From: Larry Bedard
Topic: 2673 Message: 2673

Well I'm stumped! I checked the wiring of the repaired coax to mounting AGAIN, 0 Ohms center to center,0 Ohms shield to shield, infinity center to shield, good so far. I have 2 antennas connected to the FT-100, thru the roof for my Diamond 2M/440 and hatch 400 mount for the HF(the one I fixed)if I swap antenna mounts the VHF to the HF mount (also of course move the antenna connections from the radio)the Antenna tunes right away AND I have no problems with the VHF/UHF with the "fixed(problem?)coax". The strange thing is a few post suggested I check the condition of the antenna, 28 Ohms center to chrome ring. 0 Ohms whip to center. I got 0 Ohms center to whip and 28K Ohms center to chrome ring. I tried the antenna with my FT-847 with a Base kit I made awhile back for emergency/portable operations, It's a 9" pie pan with a hole in the middle an SO239 soldered to it and 8 10' copper flex straps bolted around the rim of the pie plate and it worked Excellent on ALL bands (except 160-75 of course). Any Ideas as to what is going on?

I didn't understand your post too good, but here goes. If you get 28 ohms on the bottom of the antenna while the antenna is straight up, then your antenna is probably good. On my antenna I was checking the resistance with the antenna laying down on its side and it was reading 28 ohms. But when I held the antenna straight up it opened up and I was getting no reading on the ohm meter and the antenna would not tune. If I leaned the antenna in angle it would read 28 ohms and it would tune up just fine. So I installed the antenna in an angle until my new antenna gets here. What you can do is install the antenna where you normally use it, but don't hook up the coax to it. Then check it with an ohm meter in that position. It should read 28 ohms on the bottom of the antenna. If it does not then the antenna is bad. If it does read 28 ohms, then hook up your coax to the antenna and disconnect the coax at the radio and see if you get 28 ohms at the radio end of the coax. If you don't get 28 ohms on the radio end of the coax, then your coax is bad or one of those connectors is bad. If you get 28 ohms on the end of the coax then hook up the coax to the radio and it should work. It might take a minute or two for the timer to time out before the antenna tunes. If it still doesn't work then go back and unscrew the coax from the antenna and hook up a dc volt meter to the coax end. Then hit the tune button on the radio. You should see 10 volts on the coax end with your volt meter. If you don't then you have bad coax or bad radio, its probably the coax. Hope this all makes sense.

2675. ATAS-100 Disassembly

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-22 03:34:47 UTC
From: Cliff Holloway
Topic: 2675 Message: 2675

What's in there?
How do I take it apart?

No I don't work for Yaesu, but I can tell you what I have found out from my observations and from several sources. I am not an "expert", my intention is only to give helpful information.

Disclaimer:
The following procedures can possibly void your warranty.
**********Use these procedures at your own risk.**********
Of course I am NOT responsible for any damage caused by disassembly, or any other general messing around with this antenna or your radio, enough said.

WHAT'S IN THERE?
(And a little on how it works)
The stainless steel whip is mounted on top of a loading coil (under the rubber boot). The coil consists of copper wire wound around a "grooved" fiberglass rod. Part of the reason the antenna is guaranteed to work on 40,20,15 and 10m HF bands but not on 12,17 and 30m is that the spacing on the coil is wider at the resonant points on the coil on the "primary" bands allowing easier tuning.
The loading coil slips into the "body" of the antenna where spring loaded contacts make the necessary connections. At the base of the coil and rod is a Teflon disk that makes sliding contact with the inside of the tube and is threaded for the brass "screw" rod that raises and lowers the coil.
About 7" below the contacts is the motor and clutch assembly (at the middle rubber cover). Two wires run from the motor to the controller board that is mounted on top of the base unit.
The base (matching unit) consists of a chromed top cap which includes the mount for the motor controller board. Below this is a 3" black plastic tube that forms an insulator. At the bottom is the threaded chromed base cap that is where the SO-239 connector screws in. This base assembly is secured with pins and would be hard to dissemble without damaging.
Inside this is an RF choke coil (I'm not sure if it is air wound or on a torrid)that makes this whole antenna DC grounded. This protects the radio from damage from whip contact with power sources, static build up, etc. The coil also helps with matching the antenna and contributes to the high Q of the design.
Connected to this is a capacitor that leads to the center pin on the SO-239 receptacle in the base. This capacitor is also part of the "broad band" matching network.

HOW DO I TAKE IT APART?
1. Extend the antenna fully (40m).
2. Remove from vehicle and take it to a clean work surface.
3. Remove the whip for ease of handling.
4. Slide up the 2 rubber covers exposing the screws.
5. Remove the 3 lower screws above the base.
6. CAREFULLY remove the base by gently pulling down while using a slight rocking motion (the resistance is from a O ring).
7. Carefully withdraw the base assembly while noting the routing of the motor wires.
8. Unplug the micro connector from the motor controller board (the red and black wires that leads to the motor-clutch assembly), and set the base aside.
9. Mark on the shaft the location of the bottom of the boot, then slide the boot upwards exposing the loading coil.
10. Remove the remaining 6 screws on the antenna.
11. Carefully slide up the loading coil which also removes the motor-clutch assembly (be careful with the alignment pin).

There is more than can be dissembled, but the above steps are all that is needed for most maintenance and repairs. While you're in there, clean the moving surfaces up and oil with a light oil (like mineral oil) that won't harm plastics while taking care not to contaminate the contacts, coils and connections.

HOW DO I PUT IT TOGETHER?
(Bonus section)
1. Basically reverse the above procedure.
2. Be careful to make sure the alignment pin (about 7" long) from the loading coil to the motor-clutch assembly is in place.
3. Pay special attention to the routing of the motor wires to prevent pinching between the motor controller board and motor-clutch assembly.
4. Enjoy!

I'm not the brightest bulb in the box so would somebody tell me what ill effect may come from pumping 10 watts of RF from the FT-100 into a voltmeter.

Thanks in advance.

Thank you for this information on disassembly of the ATAS-100 Cliff.
I have not had a problem with my antenna but this is good info to keep in
my file.

2679. Best duplexer to use with ATAS-100?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-22 20:05:31 UTC
From: Chris Barrera
Topic: 2679 Message: 2679

I just started to mount my FT-100 and ATAS-100 in my vehicle. Since I am new to Amateur AND mobile equipment, I am still feeling around in the dark a bit here, hope someone can answer these questions.

1) What is the best diplexer to use? I looked in Diamond's catalog and all of their diplexers have specific ranges of frequencies assigned to the ports on the unit. None of them actually match how YAESU did the antenna output cables on the FT-100 where one antenna is HF+6m and the other is 2m/70cm. In the diamond catalog they are all pretty much HF on one and the rest on the other, or HF+UHF+VHF on one and the really high ranges on the other etc... The *ONLY* one that matched what I wanted had an asterisk that read that the port that handles above 6m is for receive only. Just can't win.

2) I am worried about grounding. Reading the several months of messages from this group teaches me that grounding is paramount. Uh, where do I get this "braid" stuff that everyone uses to ground this antenna? Radio Shack doesn't sell it. So should I just cut open a bunch of RG-58/59 coax to steal the braid?

3) I am using a diamond K400 mount on the rear hatch of my SUV. (Nissan Xterra). What is usually the recommend place to attach the ground braid to the mount? (From there I think I can find a bolt on the chassis of the vehicle.)

Appreciate all the help!

Chris Barrera

<snip>

I don't know if its 'the best', but before I started using separate antennas
I used the Diamond MX62M (http://www.rfparts.com/diamond/duplex.html) Now
I use and MX72D on the V/U port to separate 2m/70cm to different antennas
2 phased M2 loops for each band) So, now I only use the ATAS for 40m-6m.

Gary,

Without knowing how our dealers rotate their stock, it's hard to say how say how earlier production radios are being sold now. The "dots" on the outside of the boxes are inventory control tags used here in the wherehouse.

Can you also shed any light on why there are new FT-100's being sold with 9D series sn and also 9H and 9I's being sold? I assume these may be earlier ones that were brought up to new mod spec's (which is fine), if so what do the colored dots on the box mean (Blue, Gold, etc)?

Not sure it is best but I use a Comet CF-706 and it does work. Then again, you will probably get better 2M/70CM performance with a separate antenna for about the same price.....Dean

I have used a duplexer in the past and I am in agreement with Dean's statement. However, when I did a few tests on 6m and 2m SSB, I was surprised to learn that the ATAS-100 seemed to perform better. Of course, this was a non scientific test, my guess is that it is due to angle of radiation.

If you generally work FM on VHF and above, I would probably go with the separate antenna so that I do not have to tune it when I switch the radio from HF to VHF/UHF frequencies.

I have also observed that the ATAS-100 seems to jam at the top of its cycle or the bottom of it's cycle more often. Using a separate antenna, you can avoid stopping the tuning process at the bottom of the cycle.

Rene

Dean,

I agree. It is really nice that the ATAS-100 covers 2m/440 but, for those
who have the real estate on their vehicle, a separate dual band antenna with
some gain will run rings around the ATAS-100 for the same cost as the diplexer.

I've been running the FT-100 (s/n 9Hxxxx) and ATAS-100 in the car for 2-1/2
months and I truly love it.

Hello everyone.

Im about to Buy a FC-20. Is this a good option.

Have anyone had really bad results from this device?.
Has anyone had really good results from this device?.

Has anyone tried to use on of these devices in a vechicle. Not to many bands of operation will be used. It wuold be to extend the bandwidth of the relative antenna's that are being used?

In australia we dont have the atas-100. Other options would be manual tune systems, eg. MFJ-969, MFJ-945E?

Any comments appreciated?.

Thanks
Andrew Scott

Save your money......not very useful and overpriced........buy the LDG AT11 either in a kit or put together....it has a wider range of matching and can tune a shorter length of wire on 160
meters....Dale KC2PZ

From: W1RAM@aol.com
Topic: 2688 Message: 2690

Andrew,
I too agree with Dale. I have had my FC-20 for six months and really regret not getting the AT-11 from LDG instead. My complaints with the FC-20 center around it's frustrating inability at random moments to achieve a "tune" on certain bands (but the next day it will work fine), its very slow operating time, and it's maddening inability to retune itself after I've QSY'd to a different segment of the same band. I've completely stopped even trying to use the FC-20, having discovered that when I go to around 165 ft. of coax to my Carolina windom (fixed portable operation) in conjunction with the MJF-914 antenna tuner expander, I can find very low swr and full output on my FT-100 via merely the various switch positions on the MFJ. It's makes a nice paper weight, though. Cheers and beers,
Bob F/W1RAM (Aix-en-Provence, France)

I've got the LDG AT-11.

It's the best thing in my shack.

It took one Saturday afternoon to build.

Don't waste all that money on the FC-20 when you can buy a far superior
product for less.

2694. Question about memory arrangement

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-24 15:08:22 UTC
From: Paul Knight
Topic: 2694 Message: 2694

Hello! I am considering purchasing an FT-100, and have a simple question:
can the memories be arranged in banks for scanning, or do you just have one
bank of 300 (like the IC-706, with one bank of 100)?

Thank you,

Paul WD8DKY
paul.knight@...

The 300 memories can be divided into six groups of 50 channels each.

Not that I've done it...

2696. SWR inconsistencies

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-24 15:19:10 UTC
From: Timothy H. Heaton
Topic: 2696 Message: 2696

I've noticed that antennas "tune up" at different lengths depending on whether I believe the SWR meter in my FT-100 or an external SWR meter. Yesterday I got an antenna tuner, and the same phenomenon is even more pronounced. I can tune an antenna to 1:1 according to my high-quality SWR meter and the little SWR meter built into the tuner, but the FT-100 still reads high (sometimes infinity:1). Then I can adjust the tuner and get the SWR down to one bar on the FT-100 (1:1), but in doing so the two external meters show a very high SWR (sometimes infinity:1).

1) Does anyone know a possible cause for this inconsistency?

2) Which device should I try to please: the FT-100 or the external meter?

-Tim (WB7NMY)

2697. RE: Question about memory arrangement

Date: 2000-02-24 15:22:15 UTC
From: Paul Knight
Topic: 2694 Message: 2697

Thank you! I'm trying to determine if I can have the FT-100 perform both as a ham rig, and as a scanner for the Public Service frequencies I like to monitor. I'd like to remove the mobile scanner I have in the truck now, and just use the FT-100 for both. Having multiple memory banks available makes that possible.

73,

Paul WD8DKY

I think you may be hearing some speculation. As far as I know there are
no changes to the FT-100 CPU, but there were changes to the FT-847.

Hi! I am considering the purchase of an FT-100, and was hoping someone could answer a quick question: can the 300 memories be arranged into "banks" like a scanner, or are you stuck with a single bank of 300 memories (like the IC-706, and its 100 memories)? I'm trying to figure out if I still need my scanner installed in the truck for Public Service monitoring along with the FT-100.

Thanks,

Paul WD8KDY

One thing every ham needs is a dummy load. It kinda sounds like your 100 bit the dust, but I don't recall the VHF/UHF problem in the early rigs (like mine) affecting HF output (50MHz).

So until I saw the rig have no output into a dummy load, I'd be skeptical.

You asked for ideas... there's mine.

From: Alek Petkovic
Topic: 2688 Message: 2706

Sorry about the delay Andrew.

Go to http://www.ldgelectronics.com/ and look at all the options available
for ordering.

I ordered mine via fax and credit card.

If you do buy it, ask them to send the receipt separately and get them to
delare a value of around $120 - 130 US on the package. That way you'll
avoid any duty when it arrives here. They will do that for you.

My tuner has been everywhere in the last 3 years. In the car, on islands
(IOTA expeditions), on field days, on holidays, amplifier input tuning etc
etc. I've had it up against the ft-920 and ts-450 auto tuners and it shits
all over them. There is no contest.

A few friends have borrowed it and they are all similarly impressed.

Good luck,
Alek, VK6APK.

2707. FT100 plus Ameritron ALS-500M

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-26 17:26:32 UTC
From: Dan Onley
Topic: 2707 Message: 2707

Dear FT100 users,

I've enjoyed watching this list discussion since mid-December. You're a great group.

I'm considering an Ameritron ALS-500M for when I do "serious" contesting from our motorhome with the FT100 (which is a radio I've really enjoyed in a variety of portable settings).

I would appreciate ANY opinions or resources re. the ALS-500M. I've downloaded the operating manual from ameritron.com, but it includes no schematic in the online version. Use your own discretion as to whether this question would be of interest to other list members or whether to write me directly.

Lastly, it was from reading the digests of this list that I learned of a source for the unique OEM power supply cable connector required by the FT100. I'm certainly pleased to recommend http://powerwerx.com as a first-rate safe e-commerce site with fair pricing and very prompt delivery by Express Mail.

73,
Dan K4ZRA

2708. Brand new ATAS-100 with problems holding tune.

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-26 17:24:00 UTC
From: Gary Mitchelson
Topic: 2708 Message: 2708

OK, now that I have the manual tune problem figured out it has helped me looking at a problem with my brand new ATAS-100.

I have it mounted through the roof with a Comet 3D4MC roof mount using additional 5/8" outside star washers, plus I ground down to bear metal to ensure a nice ground.

The ATAS-100 will auto tune fine to all bands but after a few minutes of driving the X SWR comes on. I then can manually tune up or down to obtain match again. This may or may not hold.

Also while receiving you can hear the signal breaking up like there is a poor connection in the antenna, a quick manual tune will stop this for a while.

I don't think it is something other than the ATAS because I can put a 6M vertical in it's place and not have a problem.

BTW, don't bother dealing with HRO, they will not help even though the antenna is a week and a half old from them. And I had bought the FT-100 and a bunch of acc'y too. So much for customer care!!

It probably has to do with the coax moving around, at least that would be my guess.

I have mine mounted on the back side of my van with the coax exiting at the edge of the lift gate. I found that if the coax got moved even a few inches up or down the ATAS 100 would not tune properly. If I moved the coax then it would be ok again. Finally secured it so it can not move around.

The coax is in the liner since this is a thru the roof mount. It has no provisions to move.

Dear Group,

I''ve had my FT-100 for several months, during that time I've programmed several frequencies into the radio. During that time I discovered how to only display the channel I've programmed while in memory mode. Problem is I forgot how I did this and now that I want to expand my stored channels, I can't display unused memory channel. I keep reading the manual but I can't find out how to undo what I done.

Press the step key, and then rotate the select knob. It's set out at page 71 of my manual, down at the bottom of the page. This has caught me once or twice as well.

From: Dale L. Martin
Topic: 2711 Message: 2717

1. I believe if you check the back cover page of your manual, in the lower lefthand corner you will find two things:

A. "Copyright 1998 Yaesu Musen Co., Ltd. All rights reserved."

That pretty much puts the kibosh on scanning and making it available, doesn't it?

B. A seven character printing date (?) 4-digit, 1- letter (lowercase), a hyphen, two letters (upper case)

Mine is 9902n-BY. I bought my FT-100 back in October, but from somone who was not the original owner.

2. How do you guys know if you are talking about the same procedures? My page 71 is titled "Memory Operation on "Regular" Memory Channels (Channel #001 to#300), Memory Channel Recall.

Is that how your page 71 is titled?

If so, there are five numbered paragraphs with an italicized ending paragraph describing the memory recall process simplification procedure.

That page is 3/4 full.

You might contact Yaesu and ask them about getting updates to your manuals.

Date: 2000-02-28 03:03:24 UTC
From: Monte Stark
Topic: 2718 Message: 2718

Hi All,

My ATAS 100 seems to be stuck in the down position.

I have tried all the settings and button pushing I
can find in the book and can't get it to move.

Is there a simple way to fix this?

Thanks,

73, Ron

2719. New addition

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-28 03:06:59 UTC
From: Powerwerx
Topic: 2719 Message: 2719

Sorry for the commercial interruption.

www.powerwerx.com now has in stock the Heavy Duty DC in-line filter for the FT-100.

This Line Filter is made by Vertex/Standard (Yaesu's commercial division) for their low band mobile radio, the Vertex FTL-1011.

The line filter has the same special Heavy Duty power connectors that are found on the FT-100 and is a quick "plug in" solution.

It installs next to the power connector close to the radio.

If you are plagued with alternator whine on your Ft-100 this may be the solution to your problems.

I don't have the manual handy, but I did cover this topic in the FAQ:

http://members.aol.com/lee810/ft100faq.html#memory

Here is the text:

Memory Programming
There are a few common difficulties in programming the memories. The radio has a mode to allow rapid tuning through the memories by skipping unused memory locations. This feature must be disabled to store frequencies in an unused memory location. To disable it, place the rig in memory mode by pressing the VFO/M button until MEM is shown in the display. Then hit the STEP key to enable or disable the vacant memories selection. Reverse the procedure with the same sequence. Turning the SELECT knob will help you to determine if the radio is in rapid mode if you see it is jumping over unused memory locations.

Another difficulty is getting the memories stuck in a particular memory group. The main memory [1-300] is divided up into 6 separate 50-memory groups. You can restrict tuning to a single group by pressing in on the SELECT dial for 1/2 seconds while in MEM mode. You reverse the procedure with the same sequence. You will see an GCH appear in the lower left hand corner of the display if you are locked into a particular memory group 1 through 6. Pressing the SELECT for 1/2 seconds will put it back in memory channel mode and it will display MCH in the lower left hand corner. If you are not careful and only press the SELECT momentarily, it will put you in VFO mode and you'll have to press the VFO/M key to get back into memory mode. This is not explained correctly on page 71 of the manual.

Hi,
Try keying the mike and then push the up button on the radio. Or, push
the tune button and wait....it will finish its cycle, and then you should
be able to hit the tune button again and it should tune.

73, K.C.

2723. Questions on options

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-28 06:43:45 UTC
From: gariac
Topic: 2723 Message: 2723

Hello. I'm new to the list and have a few questions on the FT100:

1) What is the use of the CT-58 band data cable?
2) What is the use of the CT-62 CAT interface cable?
3) If I get the ATAS-100, I shouldn't need the FC-20, right/
4) It the TCXO-8 really needed?
5) I'm assuming if I want to listen to shortwave radio, I need the 6KHz filter. Are the passband filters selectable via the front panel?
6) Does the YSK-100 seperation kit connect the just the front panel, or does it do the front panel and the microphone.

2724. Re: ATAS 100 stuck?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-28 08:51:55 UTC
From: Paul R. Valko
Topic: 2718 Message: 2724

Hi Ron.

First, make sure the rig is NOT in the "TUN" (tune) mode. If it is, just give it a couple minutes to clear by itself.

Second. Key and hold down the microphone on SSB HF somewhere, and while doing that, press the "UP" button on the front panel for a half second.

As soon as the antenna starts going up, it's fixed. You can release the microphone and the up button.

From: Mike Ketchum
Topic: 2725 Message: 2725

Hello all,
I have just purchased a FT-100 and I would now like to get an SWR/Power meter to cover its entire range. Have any of you ever used any of the Diamond SWR/Power meters? I am looking at the Diamond SX-600. Any comments, praises, warnings, or suggestions?

Thanks,
Mike

After years of screwing around with all these brand-x SWR and power meters
I finally did the right thing and bought a Bird 43 and a few slugs.

Wish I'd done it YEARS ago and avoided all the nonsense.

Gene:
Other than the possibility that you're running too much mic gain, have someone listen to your signal both with the radio connected to your antenna and with it connected to a dummy load. You'll have to be reasonably close for them to hear you on the load, but they may have to disconnect their receive antenna to prevent overload when you're on your antenna. If there's a difference, then you are probably getting RF back into the radio and should try some clamp on chokes for the mic, power and speaker leads or make other changes to reduce the RF getting into the radio.

Mike:
Note that the SX-600 has SO-239 connectors for VHF/UHF. This means that
you won't want to leave it in the line for normal operation.

2729. FT100 Burst tone

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-28 12:36:00 UTC
From: Andersen, Leif Inge
Topic: 2729 Message: 2729

Hi all.

First thanks to my friend Ken KH6CQH for telling me about this page.
I bought a new FT100 and an ATAS-100 in LA in September last year. I worked mobile for 3 weeks whilst visiting US and I even managed to work Europe from my car from Hilo, Hawaii. I had no problems what so ever with the FT100 or the ATAS-100, but on returning back home to Norway I realized I had one. In Europe repeaters are opened using a 1750 Hz burst tone. The FT100 does have a burst tone and according to the manual it should be 1750 Hz. The problem with my FT100 is that the burst tone is 1800 Hz and consequently I am not able to open repeaters in Norway. I understand that Yaesu have had this problem with other FT100s, but I am NOT able to get in touch with Yaesu or the dealer I purchased the FT100 from in LA. I have sent emails and telefaxes to the dealer without any answers. I have sent emails to three different Yeasu addresses in US, without ANY answers. I am getting fed up and is starting questioning what kind of a company Yaesu really are. Is there anyone that can help me with an address to Yeasu where it is possible to get any help?

From: Ralph Encarnacion
Topic: 2718 Message: 2730

Hello Ron. Sorry to hear about your stuck ATAS-100. I had the same problem with mine a couple of weeks ago. I bought mine and it worked really good for about a week. Then It got stuck, would not go up or down. Found out that the bottom matching coil was open. Unscrew your coax from your antenna and hold the antenna straight up and down and measure from the center pin of the antenna to the chrome base of the antenna. It is supposed to read around 28 ohms. If it is open then the antenna will have to go back to Yaesu. I was able to exchange mine for another because it was only a week old. The new one is working fine, but I only had it a week so far. The reason I said to hold it straight up is because on mine, if I laid the antenna on its side, it would read 28 ohms. I later found out that if I mounted the antenna on an angle, it would read 28 ohms and it would tune up just fine. So I installed it in an angle and used it like that for a week until my new antenna arrived. I tried taking the antenna apart to fix it, but I could not figure out how to take those 2 pins out of the bottom part of the antenna. See if yours reads 28 ohms and let me know. If it is reading 28 ohms then check your coax. Hope this helps.

I have always understood that copyright prohibited the republication of all or substantially all of a work, rather than a specific portion. If Yaesu wants to make an issue of my posting page 71 of a manual in reply to the requests of users of their rig (since it's useless to anyone who doesn't have the rig) I invite them to sue me. As there is absolutely zero financial loss to them, I think there's a big problem showing damages.
Have fun, and enjoy your ft-100!

1. I believe if you check the back cover page of your manual, in the lower lefthand corner you will find two things:

A. "Copyright 1998 Yaesu Musen Co., Ltd. All rights reserved."

That pretty much puts the kibosh on scanning and making it available, doesn't
it?

Go back and re-read the "fair use" provision of the law. Copying a single page one a one time basis is perfectly legal....

Of course, I'm no attorney... I don't even play one on TV

Gene

If Chuck's idea doesn't work you might try getting into the hidden menu, and reset the deviation on I believe is F 59. Mine was set to about a -32.100. I had this problem only on the FM part everyone on only one repeater complained I sounded as if I were 5 kHz off the center freq. this drove me nuts until I met up with another FT100 owner here in Orlando. He just happens to be a RF engineer and had my problem all taken care of in 10 minutes. And it turned out I was in fact 2.7 kHz off. That was the reason for the bad audio on that repeater. but since then the Ft 100 has worked flawlessly and is a great little radio.

Good Luck

I totally agree, purchase a Bird wattmeter. You can usually find a one at a hamfest and if you ever need parts, Bird is very good about getting them to you. I have an old Radio shack model 100 laptop(shows you how old I am) that I wrote a simple 10 line basic program to perform the SWR caculations. Once you learn to use the meter, you can begin to judge what the readings are. You might want to consider a low power element for reflected power. If anyone is interested in the program, send me a single stamp SASE to my address on QRZ and I'll mail you a copy of the program. I don't want to take up space here and it might loose something in the e-mail translation process. Good Luck!

I have the Diamond sx1000. I used it to check out homemade and commercial antennas and feel it works well. It has a 5W scale for QRP use. Getting a used Bird will be a Barbie doll hunt as you need various slugs. I do have a Bird "terminal" power meter, but really don't need their SWR meter.

Incidentally, the Diamond only needs a DC source if you want light it up.

Hi Tom,
I'm using the atas100 in my car with the cometcq-5m mount. I had problems early on with it getting a good ground. My solution was to run an extra ground using some braided shield from some rg-58 between the mount attached to the car and the mount the antenna screws into. Has worked great ever since.
73 and good luck..... K.C.

The diamond k400 has been fine for me since day 1. Trunk lip installations work fine, provided you have a vehicle that is made of more than tin. I have a 1985 tbird, and have had no troubles at all, including at speeds of 85 miles an hour for extended periods. BTW, I love some of the highways in the U.S.A.. Couldn't ask for more entertainment!

In a message dated 02/29/2000 4:16:05 AM Eastern Standard Time,
FT100@onelist.com writes:

<< Hi Gang:

I just joined the FT-100 group last week. My radio and ATAS-100 ant
should arrive UPS today. I can't wait! Please give me your
opinion/experience with mounts such as the Diamond K400C or Comet
CQ-5M or other trunk lid installations. Is a truck lid mount
sufficient for the ATAS-100?

Many thanks for your advise!

Tom Ellett - KA6K - members.aol.com/tomellett/ka6k >>

Try the Diamond mount, I have the CQ5m and although it does work I think it
is not the best. It constantly loosens up, the setup is cheesy etc.. I would
opt for a new mount when I get the next car on the road... Regards.. Richy

2747. My sad, sad, ATAS100 story

Yahoo group: FT100 (1998 — 2000)
Date: 2000-02-29 16:08:53 UTC
From: Paul R. Valko
Topic: 2747 Message: 2747

Last summer I was a cheapskate and bought a USED ATAS-100 from a guy on the internet. To be honest, it wasn't even all that great a savings.

The antenna arrived and I thought is strange that it did not have a stainless steel whip. It seemed to have a long piece of welding rod or something like that as a replacement. The antenna itself looked pretty beat up, but it worked OK so I started using it.

I'm a trusting soul, and didn't really give it much thought. I even emailed the guy I bought it from and he explained that HE bought it used off someone else and that the previous owner must have "modified" the antenna because he thought that the whip that came with it was too flexible. He even offered to buy back the antenna... I didn't think it was that big a deal at the time but in retrospect, I should have taken him up on it.

A few times in the fall, the antenna would go intermittent. I mean it would not TUNE. If I pulled the antenna off the car it would work for a while.

As you all know, it really went flaky on me this winter and simply refused to do anything when it was cold out. It would work fine if it was warmed up in the house for a half hour or so.

Finally, I'd had enough and decided to take the thing apart to see what was the matter. To make a long story longer here's what I think happened.

The original owner might have thought that the whip was too springy, or he may have simply lost it, but regardless, he pulled the antenna apart to bore a larger hole in the little "cone" that the whip screws into.

When he did that, he probably broke the wire that sticks out of the coil and goes into that bullet piece to make the connection to the whip. Unless you know that there is a second allen screw holding it in place, that would be easy to do.

When he reassembled the whip, I think he may have accidentally poked a hole in the rubber boot with the wire from the whip.

The hole in the boot let moisture get into the motor mechanism.

Moisture from the motor dripped down onto the little control circuit board.

After a period of time. The ATAS simply failed. When I disassembled the antenna, the motor housing was pretty much completely rusted, the control board was covered in corrosion and muck... it was a disaster. Even though the antenna was less than a year old, there was no way I could morally

send it to Yaesu for warranty repair.

So... kind soul that I am, I basically got screwed over. A couple weeks ago I bought a new ATAS-100. The old one is a basket case.

I usually have no problem buying things off the Internet. Electronic stuff usually works fine and probably can last forever. The ATAS-100 is NOT an electronic device, it's a MECHANICAL device. You know the saying...

mechanical things
they have no heart
when the going gets tough
they fall apart.

So beware folks. I would not suggest you purchase a used ATAS-100 unless you REALLY inspect it well. Even though the person I bought it from offered to buy it back, the thing did work for a while, so I thought I was safe.

I would first check for continuity between the chrome base and the chrome ring on the matching unit (bottom) if good check for 28 K ohms between the center pin and threads on the base. If that is good I suggest you check out (if not under warranty) the Files section for "ATAS-100 Disassembly " and proceed with opening it up to check it out .

Remember, you only hear of the horror stories. Nobody complains when the antenna is working right. I am sure that the ones that work perfectly out number the broken ones by a big margin. The next alternative would be a regular screwdriver antenna. Probably works a little better than the ATAS as far as signals are concerned. Only thing is you need to key your transmitter and look at the SWR meter and hit the up and down buttons on the antenna until you find a good match. Not the safest thing to do when you are cruising in heavy traffic. That is where the ATAS shines, you just hit the tune button on the radio and the antenna automatically tunes itself. No need to take your eyes off the road. Don't let a few negative post spoil your fun. I like my ATAS a lot, even though mine only lasted a week before it broke. The new one is working fine. I got a feeling that the reason mine and others are failing is because of bad grounds or poor mounts. I grounded the new one with lots of extra grounding straps to everything on my truck and so far no problems. I will probably upgrade to a full size screwdriver antenna as soon as somebody makes an adapter for them where it will tune itself up automatically like the ATAS.

At the moment, I just want to use the HF side for short-wave and military air (lowband). Given that, I think a simple whip will do for a while.

This leads to another question. Does the FT100 alter then ATAS when "range" scanning, assuming you CAN scan a range on the FT100. I assume the antenna is only being adjusted before transmitting as that is how I would design the product.

I love mine. I'm restricted to 80 meters and 10 meters, and of course 50mhz. For those (it doesn't do 80) it's been great. No problems at all once I got my trunk lid properly grounded. It's a very slick piece of work, with no problems at all other than a poor installation at the outset. Great signal reports, and very impressed operators, from all over the U.S. and Japan.

The antenna only tunes up on the ham bands and technically you need a ham
license to tune it since it transmitts a 10 watt carrier.

2761. FT-100 Trunk Installation - de KA6K

Yahoo group: FT100 (1998 — 2000)
Date: 2000-03-02 15:52:28 UTC
From: tomellett@aol.com
Topic: 2761 Message: 2761

Hi Gang:

I'm doing a trunk install on my new FT-100 using the Yaesu separation kit and a new ATAS-100 on the trunk lid (Comet GR-5M mount). I'm going to have about 10' - 12' run from the battery back to the trunk. I'm planning on mounting the FT-100 on the upper/back of the trunk's interior (like they mount CD players). So I'll use at least AWG-8 wire with fuses at both the battery and radio ends and both +/- leads.

Anyone have experience with this particular install? Your comments and recommendations are very much appreciated.

Why two fuses per line? I would just fuse it by the battery. Note that fuses is series will blow slower than a single fuse. What happens is that as the current gets high, the fuse begins to get more resistive, which in turn lowers the current. This is not a problem for a single fuse, but can be a problem for series fuse connections. ARRL suggested fusing both the power and ground. I never really believed the ground fuse is needed, but did it anyway.

I did a similar installation on my Icom 2700 (BTW, not a good mobile radio). You can get the automotive grade wire at Home Depot. It has some coating on it to prevent damage from oil, etc. I used fusible links for the fuse, rather than one you insert in a holder because I didn't expect this fuse to blow often. I think I got the links at Kragens. I ran the wires along the side of the car by the door sills in a place where they would be unlikely to be damaged. Not having my FT100 yet, I don't know exactly how it handles the external speaker. I mounted a speaker where the cassette tape holder was located, and put the face plate in where the ash tray holder went. I went to a junk yard and bought a ask tray holder than I hacked up. I mounted the face plate in black plastic from Tap Plastics as it was not a full din size. I believe the FT100 is a regulation DIN size so that should not be a problem if you have an extra DIN holder as is common in many late model cars.

It's smart that you did it anyway even if you didn't "think" it was
needed.

You see, the fuse in the ground lead is a simple precaution in the event
the main 12VDC ground strap between the car battery and chassis were to
come loose. This could happen by corrosion or even a mechanic pulling the
ground to "disconnect the battery" while doing service work.

It that happens, your nice $1200 radio and it's ground system will become
the path for a couple hundred amps of cranking current to the
starter. Not a pretty site...

The main reason that you want to fuse the ground lead is that if the main negative lead from the battery to the engine block breaks or gets a high resistance then most or all of the ground return for the car is going to be through your coax and radio and then back to the battery through the ground lead. It can do nasty things if you try to run starting current through this ground. Many moons ago I used to work for a two way radio company and I know of at least once where this cause a fire that destroyed the car.

Mark,
This is probably the reason that the supplied power line with the FT100
comes with both sides fused (25A fast-blow). Interesting, I had never
seen this in previous mobil applications.

Gariac:
The only reason I can think of is if there could be voltage supplied
from the trunk. For example, in my truck I have a sealed glass mat battery
at the radios in back. The battery is fed by a charge controller in the
engine compartment. The #8 (welding cable) tie line I have between them
has, and needs, fuses on both ends.

I posted this once before (I thought) but it didn't show up as posted:

I was getting reports of distortion on HF SSB. It turns out the problem was my "close-talking" of the mic. When I moved back an inch or so, the problem disappeared, even though I cranked up the gain and compression to maintain the output (my voice doesn't have a lot of "punch").

2773. FT-100 Mobile Satellite Update

Yahoo group: FT100 (1998 — 2000)
Date: 2000-03-03 23:22:07 UTC
From: Jeff Sherman
Topic: 2773 Message: 2773

Just a note as promised to let people know how well the FT-100 performs as a Mobile Satellite Radio and that mobile ALL MODE satellite operation IS acheivable.

So Far, the radio has performed better than expected using the Split / DUP memory locations when using the 2 Mtr/ 430 MHz Split mode when operating the satellites. So far, I have not installed a RX preamp on the 430 side . A preamp is used when operating AO-10. The stock 20 watts and a single M2 HO-Loop on the 435 Mhz uplink works well on AO-10 especially at perigee(have not tried it at full apogee yet) .

The following satellites were used: AO-10, UO-14, AO-27, RS-13, FO-29 and FO-20. The antennas used are dual band Icom Vertical AH-32 (vertical polarization and low elevation passes), M2 HO-loops for horizontal polarization and overhead passes. Polarization / antenna switches used in the vehicle to accommodate faraday rotation during the passes . Audio quality excellent especially on AO-27 as reported. Built-in RX preamps are excellent but I had to increase the RX IF Gains of the 2 MTR and 430 bands to bring the signal levels to were they should be (special alignment menu) . I found the rule of thumb for me was to increase the RX IF Gains to give about a S3 dB noise floor without a signal on both bands.

MAIN ACHEIVEMENT was to operate all the satellites , all the modes while in motion without having to stop the vehicle, get out and point beam antennas (i.e. Arrow Antenna) .

Hope this sheds some light on some applications of this fine radio.

Jeff K7XQ

My feelings exactly Paul! I can't imagine a better combo than the FT-100 with the ATAS-100. I have owned my FT-100 for about 3 months and have not had one problem with it. I owned all the IC-706's (until the MK II G) and while they were great rigs, this FT-100 is much better IMHO. I used my FT-100 with hamsticks until about 3 weeks ago when I picked up a new ATAS-100. It is GREAT. I am working the world, getting great reports and don't have to get out of the car to change bands. It's the BEST!

Hello and sorry to ask this question if it has been already asked. I just sold my kenwood TS-50 and I am going to buy a FT-100 and maybe the Atas 100. My question is do I still need a 2 meter and 70 cm antenna also? Where can I find the specs on this antenna and maybe a picture of it? I have a very small car and was using a trunk lip mount with the Hustler MO4 mast and Hustler whips which worked very well for 10,15 and 17 meters. Any input on the rig and antenna sure would help.. Thanks.. Ross

Hi Ross,

You can use the ATAS100 on 2M and 70cm, but you'll need a duplexer to connect
the HF and VHF/UHF pigtails together. You can get a separate VHF/UHF antenna
for less than a duplexer and you won't have to retune when switching between
the HF and VHF/UHF bands, so a lot of us have decided to go that route.
Also, VHF/UHF antennas also provide some gain, which you won't get on the
VHF/UHF bands with an ATAS100. If you want to see some installation pictures
of the ATAS100, you can find them in the FAQ at:

http://members.aol.com/lee810/ft100faq.html#mobile

Here we are a year later and I bought my FT-100 at the Orlando Hamfest in February 2000. It doesn't seem like Yaesu has listened to any of these particular problems that have been reported ... that is IF they have been reported. I have been fascinated with the radio, trying everything I can. Mobile has been great, I have Hamsticks for 17 & 20. Base operation has been incredible!! I have been making DX contacts that I never thought possible barefoot with a dipole up 10 feet. I even made a contact on 2 meter SSB running 10 watts into a vertical from coast to coast in Florida (Largo, FL to Daytona Beach, FL)......

Which leads me into the problem that I noticed with my rig. After making the 2M SSB(144.260) contact I turned the volume down on the rig for about 45 minutes. When I came back and turned the volume up I had a heterodyne sitting on 144.260. The DSP NF suppressed it but not completely. I felt the top of the rig and it felt very warm so I keyed the mike quickly to bring the fans on and the heterodyne dropped in frequency. A couple more key ups and the het disappeared.

Since then I have found that the het starts at ~144.200 when I first turn on the rig. It moves up to ~144.260 as the rig heats up. I must say at this time THIS IS WITH NO ANTENNA CONNECTED. I spoke to Yaesu about it and they told me to send the rig in and they would check it out. I had only had it five days at this point and am wondering if this may be a design/manufacturing flaw. Do any other rigs exhibit this heterodyne problem, and why don't the fans run as they do in the receive mode on the 2M/440 bands?

I am hoping that I don't have to send the rig back and forth to Yaesu as I have heard several other people having to do.

> Well the first one seems to have croaked. Tom NY4I was talking to me on the way home and he noticed that his power out went to nothing. Upon looking at it at my house we put a meter on it and noticed that it gives about 3 watts out on full power. We reset the rig and same problem is still present.
>
> Here is my fear. I noticed when I operate that I can smell something WARM so I put my hand by the radio and sure enough I have a good heater going in the corner. My usual talk time is around 30 seconds on and off for 30 or so. I may get long winded and go for more than that, but this should handle this just fine. I am concerned by the heat that is put out. BTW I do not use the ATAS 100 for 144 or 440, instead I use a Diamond dual bander that is a good match for those bands.

This is a kit that allows you to use the ATAS-100 as a base antenna instead of mobile. What all is in it I'm not sure. Why it costs $85 is beyond me but then the YSK-100 is overpriced for a separation kit.

This reminds me of the "wandering birdies" of the AR8000. They used a ceramic resonator instead of a crystal, and the birdies would move with the resonator. When you replace the ceramic with a crystal, the birdie stays put.

I am just getting a FT-100 and AT-11 antenna tuner and have a few questions.
1. How accurate is the SWR meter in the FT-100?
2. Does the built in SWR meter cover all bands?
3. What size coax jumers should I use between the tuner and the radio?
4. If I decide to use an external SWR meter, what size should the jumpers be and where inline should I place the meter?

Thanks for you time,
Mike

My FT-100 is one year old too. I've got the same problem: during receiving (and only in 2Met. and 430MHz) temperature grows and the chassis become HOT.
I've tried to ask Yaesu if is normal or not, but I'm still waiting for them for a verify.
In fact the only way to cool the FT's chassis is click the ptt on to force normal transmitting speed of the fans.

Does K1GGI (or anyone) found a solution to this problem?

Hi all,
Sorry if this has already been covered, I only joined the list a few weeks ago. In the second set of menu options 70 megs is mentioned a couple of times....

Does this mean the FT100 can be coaxed into transmitting on this band???? Is there a mod for this??????

Thanks in advance,

John

Hi, Mike.

1. I haven't compared it directly with an external watt/SWR meter...yet. But, the SWR reading is derived electronically within the radio is what will control the radio's RF output and bring up the appropriate icon (HI SWR).

I would go by the radio's SWR reading, no matter how inaccurate it may be.

If an external SWR meter sees a high SWR, but the radio's SWR meter reads low, so what?

It's the radio's SWR meter that will control the output.

IF you try to bring down the external SWR meter's SWR, you may well be raising the radio's SWR and, thus, reducing the output or even shutting the output down.

If you want to check it the radio's SWR readings, use a dummy load and verify that you have unity SWR across the bands.

2. As far as I can tell, yes. It covers all bands.

3. My radio is remoted in the car, so my cabling is simply RG58. If I had the radio in the front with me, I'd be using either RG8x or RG213. The lengths involved don't amount to much as far as losses go (hf/vhf/uhf). A good quality RG58 is easy to work with and route around.

4. For jumpers, see #3. If you have a remotable SWR meter (bridge and meter sections), that's best. The bridge portion of the meter should be placed as close to the antenna tuner as possible (which, in turn, should also be as close to the antenna as possible).

However, that's generally some distance and hidden from the operating position. The next best and most convenient (easy to install/remove, one

less cable run to route through the vehicle) would be at the radio, if the whole radio is at the operating position.

Bear in mind, though, that with a non-remotable SWR meter and your radio and antenna tuner in the trunk (for instance), that you will have to have two RF feedline runs to the SWR meter. Your best bet goes back to #1, above. Use the radio's SWR meter.

2789. ATAS-100 & VHF/UHF

Yahoo group: FT100 (1998 — 2000)
Date: 2000-03-06 13:51:32 UTC
From: Barry Hinkle
Topic: 2789 Message: 2789

I just got an Ft-100 and the ATAS-100 antenna and a duplexor. It works fine on HF but on VHF and UHF, the hi swr symbol always comes on. The reception is also poor compared to my old dual-band radio. I have tried it with and without the duplexor and get the same results. I really like the FT-100 but hope I can get the ATAS working correctly.

Also, the manual states that I can manually adjust the ATAS by pushing the up/down buttons while holding PTT-this doesn't seem to work either. It does work automatically when I push & hold the TUNE. I have it set for ATAS-2.

Does anyone know of software available for programming memories?

Thanks
Barry

A simple solution would be to use a separate dual band UHF/VHF antenna. Then
you can switch between HF and VHF/UHF without worrying about retuning. A
separate antenna will cost less than the duplexer.

Let me guess, you're using the up/down buttons on the hand mic? You need to
use the up/down buttons on the front of the radio. I will add this to the
FAQ if it turns out that's what you're doing. You would not be the first.

> Does anyone know of software available for programming memories?

RT systems is supposed to be working on a version of ADMS software for this
purpose. All the other software is for CAT rig control only.

You can use the buttons on the front of the mic, not the ones on top of the
mic.

The only buttons I have on the hand mic labeled up/down are on the top of it. The buttons on the front are labeled 1-9, P1, P2 and A,B,C,D and they don't do anything with the ATAS100 as far as I could tell.

2796. Mobile arrl dx contest

Yahoo group: FT100 (1998 — 2000)
Date: 2000-03-06 18:58:23 UTC
From: Robert Gauss
Topic: 2796 Message: 2796

Worked at the ARRL DX contest this weeked with my FT-100.
Worked mobile only, 10 meters for 3 hours, 1 hr while wife
was driving Saturday, rest on drivway at home Sunday.
Worked 15 meters for 2 hours on driveway late Sunday. I
made 86 qsos, 56 multipliers, approx 15K score, 43 unique
contries towards ARRL Y2K DXCC award.

I was amazed at how much DX came back on first call. It
was so easy I am going to make my goal the y2k dxcc mobile
(ssb of course)

I modified my crappy 5in Radio Shack magmount for hamsticks
to have a real ground strap, about 18in, and drilled an
interior hole in the trunk for grounding inside. Magmount
sits on trunk lid. I use nylon strings as guy wires to
keep it from tipping off when driving. Got rid of the
funky compression fitting RS used and used sholder washers
and solder lugs. Now my FT-100 shows good and stable VSWR
and works fine.

Bob

> ...

I'll bet there are some old timers out there who are wondering if this would bring me out of the weeds. Well, here we go! It's a fact that on V/UHF Rx, the fans don't keep the temp down like they do on HF. Here's some stuff that was said before...

To streamline things here, I'll just suggest interested folks go look up http://www.onelist.com/message/FT100/1253?&start=1230.
If anybody wants, I'll rehash the topic in a new posting.
Short summary: Your fans are working as intended. Operation is meant to depend on the effective frequency, with 70.5MHz the dividing line.
'Effective' because as someone pointed out, the frequency in a 'deleted' memory (showing blank on the display) gets applied to the fan control logic.
My opinion: this seems screwy, I don't think the box should be allowed to get so much hotter under some (VHF/UHF) conditions.

I don't have an ATAS-100, but reading the manual seems to indicate that P, P1, and P2 have some limited programming capability; that is, they can be assigned a couple of different functions. Are any of those functions ones that enable the tuning of the ATAS-100? That may explain why it works on one radio but not on another. Check how the P1 and P2 buttons are assigned. I think it was on page 37.

I realized that my P, P1, and P2 buttons were doing nothing and then I found the 'lock' switch on the microphone was on. After I turned the lock off, I was able to use the P1 and P2 buttons move up and down the bands, just like they should when menu 59 is set to '1'.

Then I attempted to move the antenna with the microphone P1/P2 buttons and now the tune icon came on when I had the PTT in and pressed either P1 or P2, but the antenna did not move. The tune icon just latches on and stays on even after letting up on the P1/P2 buttons as long as the PTT is depressed, but the antenna does not move. The up/down buttons on the radio's front panel still tune the ATAS100 properly. So, we probably need to do a little more experimenting to see if the P1/P2 buttons can actually move the antenna and not just turn on the tune icon. My serial number also begins with 9I.

Back in May '99, Yaesu confirmed that what is being described here is the way the box is meant to work, fanwise. Around that time, we had a few postings here, but it hasn't come up for quite a while. I've gotten some direct mail about it so I've decided to plop the excessive explanation into the list. Hope you're not disappointed.

-

I'm afraid I took a brute-force hardware approach to the fans -- it's not very elegant.

The fans are operated by two transistors on the PA-UNIT. Q3507 runs them full-speed, and Q3003 runs them slow-speed thru R3531 (39 ohms 1W). The slow-speed condition is about 5 volts across R3531 and 8 volts across the fans. Current is about 200mA full and 120mA slow.

As an experiment, I strung a bunch of silicon diodes (1N400x) together to make a poor-man's Zener diode and put them in series with the switched side of the fans, to ground. Now, when the fans would otherwise stop (transistors off), the diodes keep them going. I tried different slow speeds by using a different number of diodes, moving the tap along the diode string.

When the regular logic wants to run the fans full-speed, it works normally, the mod makes no difference. If "my" slow speed is faster than Yaesu's slow speed, then you never see Yaesu's, you either get full speed or my slow speed. If my slow speed is slower than Yaesu's slow speed, then you get 3 speeds: normal full speed, Yaesu's normal slow speed, and mine when the fans would otherwise be off.

I stopped experimenting a while ago, and have left it running on a string of 7 diodes. You could get the same result by just grounding the collector of Q3003. I don't remember if that's easy to get at or not. The extra 120mA isn't very much compared to the box's 1.2A rx current. BTW, it's easy to wire the fans for full-speed all the time, but the noise is a factor and it seems kind of wasteful.

It puzzles me that Yaesu thinks it's a good thing to have such a big difference in the temp sensing/control based on rx frequency.

The FT-100 is shipped with an interesting accesory which Yaesu calls an "Operating Manual." I looked up IPO in the index on the "contents" page and was directed to Page 41.

It says there, that the IPO will bypass the RF preamplifier.

I'm not too familiar with this so-called operating manual, but it seems to have a lot of interesting information in it. Thanks for reminding me to look at it!

Thanks Paul,

I do have the "accesory" also - thanks for pointing all the obvious out.

Should this be used during strong signal reception OR should the ATT feature
be used instead.

A normal answer will suffice. I just bought the FT100 and have been out of
amateur radio for many many years. The manual is skimpy in what some of the
commands do or what they do.

From: Mark Schroder
Topic: 2813 Message: 2813

I understand that the fans are not supposed to run on VHF/UHF Bands and can deal with that. The REAL problem that I am having is that there is a heterodyne that starts at ~144.200 SSB and moves up to ~144.260 as the rig heats up.

With a stone cold rig the het is there.

The fans will not remove it.

Does anyone else have, or have they heard of, this heterodyne.

Can a few people with FT-100's please check their rigs to see if this is an isolated problem with my rig.

Try this:
Start with a cold rig.
Turn the rig on (with or without an antenna)
Tune to 144.200 USB.
Tune up in frequency until you hear a heterodyne and tune past it until it is just gone.
Wait and see if the het moves up to where you are tuned.

The het I am having the problem is 3 kHz wide and moves up the dial at a rate of about 30 Hz/sec when I first turn on the rig and slows down until it sits on about 144.260. Makes it impossible to talk with a few people I met on 144.260.

I am about to send the rig back to Yaesu for them to look at it and would like to know ahead of time if this is a problem with my rig or a design flaw.

Thanks,
Mark (N3XCM)

My feeling is that the IPO control bypasses a pre-amp inside the radio.
At least that's what the manual says. If I needed to reduce the gain
of the radio, I would turn of IPO, and if I needed more attenutation,
then I would use the ATT control to accomplish that.

I own a 1998 Pontiac Grand Prix an that car has an S9 noise level whenever
the key is in the ignition. The noise seems to be computer generated. I
have to use the IPO feature all the time to help cut out the noise.

GM says, "Tooo Baaad!" so it's too baad that I'll be looking at another
brand of car next time.

Anyway...

These IPO features usually reduce overload and the drop the noise floor so
they actually can help pick up weak signals that may be overloaded by
near by strong signals.

Topic: 2799 Message: 2817

Okay guys, I could have sworn that my P1 and P2 buttons used to make my antenna go up and down, but since everybody was having problems I rechecked and you guys are right, mine does not work either. The icon comes on but the antenna does not move. I thought that a while back when I tried it they used to work, then I never used them again. My antenna tunes fine with the auto tune button so I am not going to worry about it. But if anybody gets the straight scoop from Yaesu please post it here.
Thanks

I have a 98 Grand Prix GT. I haven't noticed any noise. What frequecies are you experiencing this on? I have my power cord running straight to the battery (both +/- fused at the battery) and am using the Atas-100 on a comet trunk mount with a ground strap.

The only problem I'm getting is hi swr on 2m plus the fact the Atas100 is to tall to fit in my garage w/o taking it off first. : (I'm entertaining the idea of a side ball mount of some sort. Has anyone tried this?

From: Paul Brenner
Topic: 2809 Message: 2821

I agree that the FT-100 meter is basically accurate. One bar is
1.5:1 or less.

I have a MFJ tuner that I use with a long wire, so I pay a lot of
attention to SWR when I'm using that. I can confirm that the lowest
SWR on the tuner correlates with lowest SWR on FT-100. So even
though the FT-100 meter is fairly broad, if you get a low SWR
indication you can be confident that this the case.

2822. Returning new FT100 and ATAS100 to Yaesu

Yahoo group: FT100 (1998 — 2000)
Date: 2000-03-08 19:28:52 UTC
From: Gary Mitchelson
Topic: 2822 Message: 2822

I am sending my new 9D sn FT100 and ATAS-100 to Yaesu for some fixes.
Recap below:

? Check ATAS-100 for intermittent SWR problem
? FT100 intermittent self-oscillation of the TX (most severe at 6M and 10M)
? FT100 intermittent High SWR indication even though SWR is low
? FT100 Poor AM TX quality
? FT100 Low S meter indication on 144 and 440 MHz
? FT100 Bring up to latest mod levels

I will post a follow up later.

Gary

I was already to send mine back I'm wondering if you could describe the self -ocsillation? Mine sounds like a warble only on 10mtrs when the car is running. I thought it might be from vibration the way I have it mounted. I called Yaesu and the tech said to tie a 10uf 20v cap across the power line at the radio.

2824. FT-100 Tunk Install? de KA6K

Yahoo group: FT100 (1998 — 2000)
Date: 2000-03-09 18:30:26 UTC
From: tomellett@aol.com
Topic: 2824 Message: 2824

Hello Group:

I'm doing an install of my new FT-100 in the trunk of my car. I've run a 12' line direct from the battery using AWG-8 flex cable. I have also soldered all splices in the line (my EE friend says that will help a lot w/voltage drops). So the FT-100 is mounted like a CD changer on the top/back shelf in the trunk. Of course, I sanded both surfaces on the mount and shelf for a good ground.

My problem at this point is that it looks like I'm going to need to bond that top/back shelf to the body. Because, . . . yep I blew a fuse right a way when I connected power to the FT-100. Ran out of time at that point - but, I plan to do a contenuity check on top/back shelf right away.

Also, got some speakers mounted on that trunk shelf - do you think the FT-100 will get into them?

Any suggestions or recommendations on my FT-100 trunk install is greatly appreciated!

Best 73's to all - de KA6AK

RF can and will get into the speakers in some cases. Use toroidal cores with the speaker leads wrapped around them if you get that problem. Also, be darn sure you have extremely good grounds when trunk mounting the FT100. RF is easily fed back into the radio and the SWR icon will begin to randomly appear especially on 17, 15, 12, and 10 meters. Ferrite beads on the coax may help, but essentially, grounding is the issue. Have been fighting this for 6 months now!!

Has anyone played around with chokes or shielding to solve the false high SWR indication?
Mine is very pronounced with the ATAS100 on 6M, much less of a problem with a 1/4 wave whip in it's place.

Will be sending to yaese next week but wanted to play around somemore this weekend on this problem.

The ATAS100 is useless right now.

Tom,

Glad to see your post about using a separate (& large) power AND ground to the trunk installation. There have been several posts recently about the need to do this and fuse both lines. One post mentioned using a set of fuses at both ends but that is a mistake from the voltage drop point of view. After all, a fuse is really a resistor (e.g. voltage drop) and melts when the current through it is excessive. Of course, if there is a second battery in the trunk in parallel with the front one, then a dual set of fuses would be prudent because the important thing is to put the fuse as close to the battery(s) as practical to protect from a fire if the hot lead gets pinched and/or shorted enroute to/from the trunk (from either battery). The ground lead fuse is just as important as the hot lead in order to protect your equipment from being an attractive DC path from the car chassis (through the radio chassis and/or antenna mounting) through the radio internals (pcb, etc.) for car accessories or the starter seeking the battery negative terminal. Many expensive radios have been 'totaled' by resistive, intermittent or broken battery-to-engine-to-chassis ground straps. This happens a lot due to a corroded negative terminal braid wire crimp at the battery when the radio installation uses a different (better) battery connection.

My approach has been to dig through the Dayton (and other Hamfest) '2-way' tailgater's junk boxes for the dirtiest (e.g. cheapest!) power cable for the older Motorola and GE mobile rigs. These older high power rigs used some great power cords with extra thick RUBBER jacketed large gage power cords, and many have an additional large ground line to bond at both the engine and remote ends to help keep electrical noise minimized with a separate extra ground. I usually find 'greasy' 9-15 foot harnesses for $5 to $15 and you can't beat them for their 'real copper' value. Some come with high current fuse breakers, but I replace them with fuses for a little less loss, and the breakers only protect the hot side. Be careful not to waste the copper mass by going into and out of a fuse & holder that has a smaller gauge wire or fuse/terminal. There are some large gage heavy duty fuse holders available, but harder to find. Try marine and industrial supply houses. Use a fuse sized for the radio at maximum current load and some margin, but less than 150%.

On the trunk deck ground bonding issue, it varies with each vehicle. Most cars have the back window deck either fully supported, or cross hatched with metal cross braces which are usually well bonded to the car body at each side, and sometimes bonded at the back seat rear support braces as well. Be cautious, because some cars use a composite (insulated) deck material, or even a floating metal structure that is not bonded electrically to the body at all. You can never have too much ground braid strapping, but you can have too little. Connection to bare metal is the watch word.

That brings up the next issue; the grounding 'electrical length'. The length of grounding straps ARE important. Depending on the frequency, routing and wire

type, they can be sympathetic radiators or appear as an 'open' at some wavelengths. The simple rule is; short, shorter, and shortest. Many of us use a trunk lid or lip mount for antennas and think we have done a "good" job of grounding (but not bonding) our trunk hatch lid by adding a ground wire connected to the trunk shell and routed down along the hinge arm and connected down inside the trunk area (usually at the same rear window shelf you are dealing with). Some poor souls don't even do this step. Is there any wonder when they can't explain why the antenna and rig act weird on some bands, or all the time?

Please don't fall into the trap of thinking that the trunk lid (or hood, doors or anything else that moves) is grounded through the hinge! Even if the hinge point has worn enough years and made it through the paint from manufacturing, it still is an intermittent 12"-24" mini-antenna (resonant on some frequency) stuck between the trunk lid and the body. Therefore, many mobile installations have a trunk mounted antenna that is a poor performer due to this inconsistent counterpoise problem.

I am in the process of electrically bonding (not just grounding) the deck with a disassembled knife switch arrangement inside the trunk seal near the trunk hinge connection and immediately adjacent to the body edge. The wiper half is closely bonded to the car body and the 'blade' is bonded to the trunk lid and moves into the wiper as the lid is closed. This results in very short DC and RF ground paths, but is a little tricky mechanically.

At the rear trunk opening corners (latch edge of trunk) I am installing two door electrical contact assemblies removed from the sliding doors of family vans in the salvage yard. (They are available as spare parts but get expensive!) I take the small assemblies out of side sliding door and door struts of Chevy/Pontiac/Olds vans. They have moving metal tipped plunger rod contacts that protrude out of a small plate to contact with a flat plate on the door pillar that has contact 'strike' pads when the door
is closed. The vehicle uses these to pass electrical door lock and other wiring into the floating/moving door when in the closed position. I mount the plunger assembly inside the trunk lid at the lid edge but inside where the gasket seal will seat. The striker pad is
mounted down on the body just inside the gasket. Both use the shortest electrical connections to the body parts as possible.

The plunger contacts are spring loaded and reach out about 1" when fully extended with an open lid. This length of movement allows for maintaining a good electrical connection even with the typical trunk lid vibration movement on and off of the seal gasket when the trunk is closed and vehicle is in motion. Newer models of vans with more door accessories use several plungers per assembly instead of the 2-plunger units of the earlier model vans that I use. Maybe over-kill with four points (knife switches on both hinges, and lower left and right side plungers) of SHORT grounding, but like ground straps, you can't have too many! I want the radiation fields to be between the antenna and the body shell, not between the trunk lid and body across the gasket.

My car has the vehicle computer, factory stereo amps and other electrical assemblies attached to the back of the rear seat support panel. That places them immediately below and beside my HF and VHF/UHF rigs. This configuration

REQUIRES many ferrite cores, copper sheet tape and GOOD grounding (even re-grounding the vehicle boxes) to coexist. Any noise or radiation problem can be cured. It is just a matter of how logical and persistent you become.

FYI, you really shouldn't parallel batteries, i.e. one under the hood and one near the radio. The problem is when you start the car, both batteries would be used to start the car. You can get battery isolators at auto stores to prevent this from happening, though I never tested how well they work. Local power for the radio is a good idea if you need to leave it on for a long period of time. You would hate to drain the auto battery with your ham radio to the point where you get stuck and need a jump. If you are off road, that could be bad for your health. Anyway, the point of the isolator is to act like a diode, prevent current flow from the radio battery to the engine compartment battery. A real diode (even a shottky) would have too much voltage drop, so I suspect these isolators have a current sense circuit and maybe a relay or large power fet.

Regarding this knife switch trick, couldn't you just connect the two metal structures with a fat braided wire across the hinge? I'm referring to the type of braided ground cables you sometimes see from the engine block to the chassis.

You are absolutely correct. I failed to mention this scheme. RV and tow truck operators, and other operators of large vehicles with multiple batteries, are quite familiar with these devices and for the reasons you mentioned.

>"Regarding this knife switch trick, couldn't you just connect the two metal
>structures with a fat braided wire across the hinge? I'm referring to the
>type of braided ground cables you sometimes see from the engine block to
the
>chassis."

I acknowledge that the arrangement I described is overkill, But, if you are referring to making a deck-to-body grounding connection near the trunk hinge with a single flexible braided wire long enough to allow for the lid hinge movement/clearance, then that was the situation I am avoiding. In other words, the length of grounding/bonding wire required to service that length of travel of the hinge and the associated trunk lid separation from the car body (12"-20"?) is significant (at RF frequencies). The contact method I'm using keeps this entire bond length to a couple of inches.

But, if you were referring to a method of pressing two patches of braid together when the lid closes, one on each side of the seal, then that could make the bonding path less than my suggestion. This braid-to-braid compression method is frequently used to bond a lid to the chassis in high quality Ham, commercial and military radios. I am just trying to dress the appearance up a little while keeping in mind that a car's trunk lid moves around a lot more during travel than most folks realize. Facing pads of braid could flatten and separate from each other during lid movement if not kept 'springy'. Maybe with some foam underneath them, or some other method, would prevent this compression. Again, my knife switch and plunger suggestions are a bit much, probably too anal retentive. They are just approaches to solve the SHORT bonding length and lid movement problems.

Thanks for the comments. 73, Ken, kd3vk@...

Now that I've thought about this, the grounding strap probably isn't the way to go. However, you can get extremely "springy" copper that is used to seal high end electronics from RF leakage. [I don't know the technical name of this product, since I've only bought them at surplus shops.] These copper strips would make an overkill connection, and would not require any precision in the installation. I would use strips on both surfaces and let them touch to make the contact.

I used a heavy-duty trunk-lip mount to hold my ATAS on a Honda Civic.

I find that the ATAS-100 works remarkably well as a 2m/70cm antenna. However, there's quite a bit of SSB activity here in California, so yesterday I went to M-squared in Fresno (Open house, flea market, free food, good deals) and purchased a "Bigfoot" magmount and a couple of HO-Loops for 2m and 70cm. So far it works great up there at 7 feet, but I still haven't installed the 70cm antenna yet. I'll need a 2m/440 duplexor to combine both bands onto one feedline. Then I'll use a 2-way switch to allow the use of the ATAS (nice to have polarity diversity for working satellites or people who don't have horizontal antennas.)

Eventually I plan to stack a pair of the loops on each band, wow, this stack will be 11 feet high! Hmm, perhaps I should save that for mountain-topping. Sure does make it easy to spot the Civic in parking lots :-).

For info on the antennas see http://www.m2inc.com

Whew, that's a rather long first posting to the list! I have had my FT-100 and ATAS-100 for about a month, and had the ATAS die on me after 3 days (would not move up or down.) Sent it to Yaesu and they fixed it under warranty, even though I bought it second-hand! (I did include a copy of the original sales receipt.)

I had to add a 6 foot extension to my coaxial cable in order to get the ATAS-100 to auto-tune properly. The trunk-lip mount only had about 4 or 5 feet of coaxial cable attached, which seems to have a negative effect on the SWR sensor in the rig. This possibility is mentioned in the owner's manual, but it is weird enough that others may have missed it.

At least one other person I know had a similar problem. Luckily the fix is simple and effective.

John KJ9U

2834. Trimming the ATAS whip

Yahoo group: FT100 (1998 — 2000)
Date: 2000-03-13 15:02:32 UTC
From: Paul R. Valko
Topic: 2827 Message: 2834

Happy Monday Moanin'

Since I purchased a new ATAS100 a couple weeks ago (to replace one I bought used that was screwed up by the previous owner) I have been bothered by the seemingly high SWR on VHF.

It would be interesting to know how many "BARS" your ATAS shows of SWR during 2M transmit. Mine was 4 and sometimes 5.

Sunday I put my MFJ analyzer on it and (surprize) the 2M SWR was about 3:1. The antenna was flat at 139 MHz. The MFJ analyzer is about the most useful thing a ham can spend $200 on.

Cautiously, I cut small pieces off the ATAS whip and watched as the 1:1 SWR point slowly climbed frequncy. I was carefull to make sure that the 40M band would tune at 7.000 MHz also.

Once the SWR was below 1.5:1 on the high end of 2M, I decided that was good enough and stopped trimming the whip. it still works fine on HF, even 7.000000000, and now I only get one bar on the FT-100 SWR meter.

I ended up trimming almost two full inches off of the whip!

Works fine on UHF, too.

Thought I share that with you folks.

Had exact same problems with mine on 17, 15, 12, and 10 meters. Used 5 ft of RG8 with a ferrite bead on the RG8 and the jumper that goes into the radio. Also made sure the ground was effective. You must, repeat must, have a good working ground or RF will feed back into the sensor and give you the SWR indicator icon. It's a simple fix but took some time to figure out as the SWR showed flat 1:1 on all those bands.

Sure... I'll measure it later. How many BARS does your FT-100 show on 2M
and 440MHz???

Or... have you ever checked the SWR of the antenna with a "real" SWR/Power
meter?

Off the top of my head....I haven't used the ATAS on 2m/70cm in a long time,
I run phased loops for both those bands now.

Fully retracted I remember 2 bars on each band.
Most often I would jump from 2m to 10m and back leaving the antenna tuned in
the 10m position. Doing that I would sometimes get a 3rd bar but usually
only the two.

Measured SWR with an MFJ259b on 2m (fully retracted) was 1.2:1. When tuned
for 10m it went up to 1.5:1.

Measured SWR on a Yaesu 2m/70cm meter it showed 1.1:1 on 2m and 1.2:1 on
70cm (retracted) and 1.5:1 on 2m when tuned for 10m. 70cm when tuned for 10m
was somewhere in the 2:1 range (I considered that unacceptable SWR power
loss at UHF and didn't continue to use it that way, so my memory is very
fuzzy there.)

Is this the cure?

The only PL259 cable I had was a 15' piece of RG8X. So I put it in-line anyways, lo and behold the SWR problem seems to be gone. The instant I remove the coax it is back.

Now what is the magic length? I am using a Comet 3D4MC (12.5') cable as the main cable. 12.5' is to short, and 15' extra works. What can I get by with? I hate PL259's that is why this is the only one I have, everything else is N.

Had exact same problems with mine on 17, 15, 12, and 10 meters. Used 5 ft of RG8 with a ferrite bead on the RG8 and the jumper that goes into the radio. Also made sure the ground was effective. You must, repeat must, have a good working ground or RF will feed back into the sensor and give you the SWR indicator icon. It's a simple fix but took some time to figure out as the SWR showed flat 1:1 on all those bands.

Gary..... wrap the coax through a ferrite donut close to the base of the antenna. This should stop the high swr problem. I think the length of coax was acting like a choke, which you can make with the ferrite donut. Dale KC2PZ

2841. No tx on any band

Yahoo group: FT100 (1998 — 2000)
Date: 2000-03-14 05:23:39 UTC
From: JIm Turner
Topic: 2841 Message: 2841

I have been very pleased with this radio until tonight. I was talking on the local 2m repeater and all of a sudden, the TMP(temp) icon is on the display and I have no output. I checked the other bands and no tx on any of them either. I have mounted my radio under the seat of my F-150 Ford pickup. It seems that my briefcase had slid under the seat and blocked the fans on the back of the radio. I use a comet dual band antenna for 2m ans 70cm. The SWR is fine. I have tried BOTH of the resets described in the operators manual to no avail. Is there any way to restore normal operation without boxing it up and sending it back in? I even lowered the pwr output on 2m to 5% and no tx. Please help.....

Gary,
That's the fix! The ferrite bead that I used is the split type available from
All Electronics at 800-826-5432. If you encounter any other SWR icon issues
buy a few and add them to the antenna coax. I use a Diamond mount with about
6' of RG316 and then a 5' section of RG8U added on. If 15' works you can
leave that. Loss on HF is negligable. Happy mobiling.

I have been having a high SWR problem on 10M with my installation. I didn't see it initially, but it cropped up about a week after I had been using the radio. I have the standard length of thin coax that comes with the Diamond K400 mount (~10ft), plus a Diamond C110 (10ft) extender.

After reading about the reports of solving the high SWR problem by adding lengths of coax, I added a 6' RG8X jumper and the 10M high SWR problem went away immediately! However, the high SWR resurfaced on 15 and 17 meters which were previously unaffected by it. I substituted a 15' length of cable and everything got worse on 17 M through 10M so I went back to the 6' jumper. The 6' jumper can be coiled up or spread out with no difference to the improvement it makes on 10M. Then I tried a 3' jumper and it appears that the high SWR problem has gone away on all bands! I won't declare victory until I use it like this for a week or so, but I was pretty astonished it worked.

I've tried adding ferrite clamp-ons in many places with no apparent benefit including on coax near the antenna with the coax wrapped around it like a donut. I also have both the antenna and radio chassis grounded to the car frame via 1" wide by 6" long braid which I consider to be a good RF ground. So far, nothing had an effect on the SWR like adding the coax jumper to the feedline.

I have an SWR analyzer and have confirmed that the antenna tunes fine on all bands, it's just that the radio 'thought' it saw a high SWR even when it was low on 10M.

You guy probably already know this, but coiled up coax is effectively the same as a ferrite. The intent (to my understanding) is to introduce a common mode inductance in the path, which isolates the grounds. This works well at VHF freqs, but the loop would have to be huge for HF.

Sounds like the normal blown finals syndrome. Out of curiosity, can you still receive very well? On 2 of the 3 occasions mine has blown I lost 90% of the rx as well as complete loss of tx.

I mentioned that the 6' length of coax had the same beneficial effect whether it was coiled up or spread out which is counter to the theory that it is working as a choke. I also mentioned that ferrites on the coax had no effect on the false high SWR indicator. The 3' coax worked even better than the 6' coax and it wasn't coiled up at all. I work with some RF experts who may be able to help explain it. Maybe there are even some RF experts on the list who want to take a stab at it.

Yes, I can receive all bands as normal, just no transmit. Is there
any significance to the TMP icon staying on the display? I can't
seem to get that icon off of the display. I can't transmit on HF in
addition to VHF/UHF.

I've never seen the temp icon before(except the picture), but I just recently had my radio updated, so it may be something that they have changed in the firmware. Any of the times my radio has failed, the radio was extremely hot to the touch, but never had the temp icon come on.

As it stands now, I'm on the 3 strikes your out death watch. I've now had the finals replaced (among other things) 3 times on the same radio. Here in California, if it happens the fourth time they must give me a completely new radio, repair is not an option. Its actually been back four times, but only 3 of the times was finals.

Well, mine was warm, but not HOT. It was warmer at the back by the cooling fans, by the finals, but barely even warm towards the front of the radio. Now the TMP icon has seemingly locked up the radio from functioning. All of the settings are changable, but no TX.

2853. FT100 and FC20 Tuner

Yahoo group: FT100 (1998 — 2000)
Date: 2000-03-15 13:03:33 UTC
From: James Pope
Topic: 2853 Message: 2853

I just purchased a Ft100 and a FC20 tuner. I have a question in reference to the hi swr icon that come on, on the radio. I notice that even when I tune a load that I know has a swr of much less than 3:1 the tuner tunes that radio and the radio displays the tunning icon. When it gets done it then displays the Hi SWR icon for a few seconds then it dissappears. The swr appears to be low and I show full output on power. Is this normal for it to display the hi swr icon for a second after tunning even though it tuned the antenna ?

Thanks

James

Hi
Has anyone opeened up the tx side of this rig.
I have the mod from a internet site to mod this rig fully
it looks easy!!!!
What your views?
Or send it to Castle for them to do?
John

Contacted Yaesu today. They told me to box it up and send it in to
them for repair. There are no resets that the end user can do to fix
this problem. Probably dead finals.
The only thing still puzzling is the fact that I wasn't using HF at
the time and HF will not transmit either. Possibly locked up the
processer when I got the TMP overload.

2861. ATAS Whip Antenna

Yahoo group: FT100 (1998 — 2000)
Date: 2000-03-16 10:13:59 UTC
From: John Roe
Topic: 2861 Message: 2861

Hi,

A friendly piece of advice.

I have had an ATAS 100 antenna for a long time. I love the antenna. However, somehow the whip portion of the antenna broke-off. When it does it breaks right at the where it mounts into the base. This presents a real problem in trying to get the small portion left in the base out so you can put a new whip in.

A suggestion, go to a hobby shop and get a package of wheel collars and put one of the on the whip just above where it enters the base. Wheel collars are small metal donut shape things for holding wheels on landing gear wire on model airplanes. The have a hole through them for the landing gear wire and a set screw to hold them onto the landing gear wire.

One mounted on the whip just above the point of entry into the base should cause the whip to break above the wheel collar. Then you can remove the collar and have a piece of the whip left to use to pullout out of the base of the ATAS.

I am trying to figure out a way to get my broken off whip out now. Any ideas would be appreciated.

Thanks and 73's

John....KE1CQ

2866. Stingy S-Meter

Yahoo group: FT100 (1998 — 2000)
Date: 2000-03-16 17:25:09 UTC
From: James Pope
Topic: 2866 Message: 2866

Has anyone noticed a very tight, or stingy s-meter on the FT-100 while using fm mode ? I have two repeaters very close to me and on all the other 2 meter radios and ht's that I have owned they all received these repeaters full scale on the s- meter. The FT-100 barely registers a s-5 reading. Is there something I am missing in the menu to increase the radios sensativity ? Anybody having this problem or know of the fix please let me know.

Thanks

73 James

From: GARY GADWA
Topic: 2866 Message: 2868

Gary and James,
Yes the S-meter is stingy, But the Radio is NOT lacking for sensitivity.
Actually many radios have much to generous S-meter readings.
I live in a very remote area where the closest 2 meter Repeater is 130 miles
over the mountains and the FT-100 matches or outshines many other radios
I've used to hear those distant repeaters. If you are really unhappy with
not seeing the S-meter bounce around, you can go into the extended menu
system and crank up the S-meter deflection......

73,
Gary

You can find the answer to this and many other questions in the FAQ:

(http://members.aol.com/lee810/ft100faq.html)

Here is the section on the s-meter

S-Meter Anomalies

Several owners have noticed that the S-meter on the FT100 tends to be
somewhat stingy, particularly with FM repeaters. Many radios will give 60+dB
readings on local FM repeaters whereas the FT100 will rarely register more
than an S-9. Some responses to the FT100 mailing list indicated that the
FT100 was correctly reporting signal strength whereas all the rigs that give
readings such as 60+dB were overloading and going into limiting. If you
would like to make the S-meter more sensitive, here are the procedures:

First off, tune the radio to receive a strong signal from a local 2M FM
repeater.

Next, to get into the alignment mode, turn the radio off, now press the [A],
[B], and [C] keys, and hold them in while you turn the radio on. Now press
and hold the [FUNC] key, as you normally would to get into the Menu. You'll
find that the Menu is now different.

Rotate the selector knob until you find "F-07 [S FULL SCALE]" on the display.
Make a note of the current setting of this item, so you can go back to it if
you want to. Now adjust this item just like any other Menu item, by rotating
the main dial, until you get a full scale reading on the S-meter.

There also is an adjustment of the 144 MHz RF Gain (F-01) and the 144 MHz IF
Gain (F-05). Perhaps a little adjustment to the RF Gain would help with the
weak repeaters. Whatever you do, make a note of the original settings of
these items. Adding too much front end gain can degrade the intermodulation
performance of the receiver section. Also, if you change the RF or IF Gain,
the S-meter indication will change, too.

Press the [FUNC] key to exit the alignment mode.

If you have the equipment for it, you can more accurately adjust the s-meter by injecting a 14.200 MHz signal in USB mode into the antenna at +95dbmicroVolt and adjust F07 to read S9+60dB.

From: Michael Jones
Topic: 2866 Message: 2870

Its primarily the differnce between how the radios determine the S-meter deflection. I've done some digging through the ARRL archives on some rigs that we may be familiar with. In their reports, they indicate how many volts of energy is required for S9 deflection. 'Standard' is 50 at 14.2MHz. i.e. anything less then that is a more generous meter and anything under that is more stingy.

This information is NOT an indication of sensitivity.
All the 'mV's are actually micro, not milli. For some reason that is the way it copied micro symbol from the ARRL documents. Comments in [ ] are my own

FT-100
S9 signal at 14.2 MHz: preamp off, 32 mV; preamp on, 15 mV;
52 MHz, preamp off, 28 mV; preamp on, 6.5 mV; 146 MHz,
preamp on, 5.8 mV; 432 MHz, preamp on, 4.3 mV.
[Notice how the meter requires less energy on the higher bands...this is intentional due to the typically weaker signals.]

FT-1000MP
S9 signal at 14 MHz: preamp off, 335 mV; preamp on, 100 mV.

FT-847
S9 signal at 14.2 MHz: preamp off, 65 mV; preamp on, 20 mV;
52 MHz, preamp off, 45 mV; preamp on, 15 mV; 146 MHz,
preamp off, 22 mV; preamp on, 9.1 mV; 432 MHz, preamp off,
39 mV; preamp on, 12 mV.

FT-920
S9 signal at 14 MHz: preamp on, 50 mV.
[52MHz wasn't listed]

FT-8100
S9 signal: VHF, 4.2 mV; UHF, 4.7 mV.

FT-8500
[S9 signal not tested]

FT-5100
[S9 signal not tested]

FT-2600
[S9 signal not tested]

VX-1
S9=3.5 mV.

So, draw your own conclusions...
My personal conclusion...ignore the S-meter. The proof is in the pudding.
Even though the S-meter may read lower, I would expect that you can work
repeater X from farther than any 'normal' mobile rig off the same antenna.

Mike

I had a simalar problem with my FT 100 except the high SWR icon showed on the 70 cm. band. I sent it back to the dealer who said it was a bad part. I can't remember what part. He didn't have one and nither did any other supplier he contacted. It had to come in from Japan. Or so he told me. 73 DE Tom VE6TRM

2872. Update on X SWR indication

Yahoo group: FT100 (1998 — 2000)

From: Gary Mitchelson
Topic: 2872 Message: 2872

Well here is an update on my problem with the ATAS100 and FT100. If you will remember the ATAS would always tune but when I TX's either the FT100 would go into oscillation or the X SWR would come on with a full SWR bargraph. This was very pronounced on 6M.

The suggestion of adding additional coax seemed to do the trick but was not 100%. So I made up a new 10' section of RG-8X but I put 5 1" long type 68 ferrite cores on one end, the end I attached to the FT100.

In two days I have not seen a problem on 6M and the other bands look good too.

James:
This is a frequently asked question. There is nothing wrong with your radio--it is reading correctly. The S-Meter on the FT-100 reads correctly for signal strength in FM mode. Most other FM tranceivers do not. Keep in mind that full scale on the FT-100 is (I believe) S-9 +60db, which is an extreamly strong signal that you won't see unless you're just about at the repeater. You should see S-9 type signals generally but it's going to be very rare that you'll get anything close to full scale, even from repeaters.

I had the same problem as you except by problem band was 10 meters. It would tune up fine on 10, but when I transmitted, I got the high swr Icon. When I hooked up my Bird watt meter up to the radio, I notice that I did not have a problem any more. I notice that I had to add a 2 foot piece of coax to the radio to put my Bird watt meter in line. So I left the extra 2 foot piece of coax in line and removed the Bird watt meter and everything worked just fine. I know I can't have a ground problem. My radio is mounted underneath the seat with a 3 inch ground strap going straight into the floor board that I scrapped the paint off first. The antenna is mounted on an aluminum headache rack on my pickup. I scrapped the varnish off of that too and added a ground strap from the base of the antenna, straight to the frame of the truck. You can't get a more solid connection. I think for me the radio was picking up RF through the remote mounting kit. I can't figure out why adding a piece of coax will fix the problem. I don't know why these radios are so sensitive. Some people like me, ground everything and still have problems, and some people leave the radio sitting on the front seat and install the Atas on a mag mount, and have no problems, Go figure.

2875. FS: FT-20 Antenna Tuner

Yahoo group: FT100 (1998 — 2000)
Date: 2000-03-17 03:05:46 UTC
From: Charles Stampf
Topic: 2875 Message: 2875

I have dor sale a Yaesu FT-20 Antenna Tuner in pristene condition. Automatically tunes your coaxial fed antenna from 160-6 meters. Includes control cable to mate with FT100 tranceiver, coaxial jumper cable and instructions. This tuner is powered by the radio and will match as follows: 1.8 - 30 MHz - 16.5 ohms - 150 ohms 50 - 54 MHz - 25 ohms - 100 ohms Contains 100 impedence matching memories for very fast tune up. Can be installed in your auto or used at your home station. Size - 10.2" x 2.2" x 7.6". I no longer need this tuner as I now have a screwdriver antenna installed. First $150.00 takes it. Certified check or money order insures prompt shipment. Add $5.00 shipping costs.

This unit works well as long as you're not attempting a gross mismatch. I've had it match a 5:1 SWR just fine. This tuneer makes a fine addition to your FT-100 station.

The FT-100 has a real S meter compared to the loose versions on most FM radios. I have tested mine on a IFR 1200 Super S service monitor and the sensitivity is as good or better than any other dual band FM radio I have. The FT-100 shows S9 at 100uv where most other radios achieve this at 10 to 25uv.

The age old addage applies...Can I hear you? yes or no.

I thought those numbers were a bit low myself, but they may have been from an earlier production run than my unit. A friend of mine also has a FT100 and we observed similar numbers to mine with his. They were bought from different vendors at about the same time. I didn't get overly fancy with my test. I generated a signal on vhf and uhf dev at 3.5khz and ran the level up to where s9 was solid on the meter. Sensitivity was checked at 12 DB sinad and agrees closely with the ARRL lab numbers.

I have easy access to the service monitor, so I can run any other tests you anyone on the group would like for comparison.

> I am trying to figure out a way to get my broken off whip out now. Any ideas would be appreciated.

Hi John -
I can't even get my whole one out these days -- I'm thinking maybe there's some corrosion.

So I guess just turning it upside down and whacking it doesn't do the trick, huh?
Suppose you could access the side of the stub through the setscrew hole and make a nick or drill a small dimple somehow,
then insert something that would engage it just enough so you could pry it up a smidgin.
Once just a little is sticking out, grab it with the nose of a pair of nippers or the like.
Along the same lines, if it can't be teased up like that, you could try to remove just enough material from around the rim
of the socket so you could grab the end. Drill two shallow dimples or make two shallow saw kerfs on opposing sides, maybe.

If two of us submit the winning entry, will duplicate prizes will be awarded??

Try hot/cold cycling. The hotter and colder quickly is better. Don't over do it or something will melt ! This method has always worked for me on other parts. Letting it sit with penetrating oil for a few days is another method. This will only loosen it up, you still must grab it some how. Maybe a small (# 60 drill or so) hole drilled into it from the set screw access hole, then pry it up to grab.
Small things are hard to get out like that, good luck.

Chris

Castle has the best documented mods I have run across !
This mod is simple to do, just follow directions (read them
about 5 time so you really know what is being done).
I have applied it to my FT-100 and it performs as indicated
in the mod. I just wish I could get to the ROM, EROM
(or what ever) and get it to Xmit on the 220 MHz band.

The lack of 220 transmit seems like a goof in the design. On the left coast
and west, there is the CONDOR net on 220 that would be great for traveling.
Usually there is some sort of filtering involved with transmitter power
amps, so probably this mod can't be done with a rom change.

For what it's worth, a ham dealer in Germany is selling FT-100's with the optional filters and TCXO-8 installed. They have dubbed it the "FT-100mkII" so as to avoid confusion with the "stock" units also available at their store. The rumor that Yaesu is about to replace, revise, revamp or otherwise alter the FT-100 are simply untrue.

If you go to this web site you can see a blurb about the Ft100 MKII rumor
scrolling on the right side of the screen:
http://www.mlands.co.uk/default2.asp

I'm still searching.....

From: "Mike Krueger" <mikek@...>

For what it's worth, a ham dealer in Germany is selling FT-100's with the
optional filters and TCXO-8 installed. They have dubbed it the "FT-100mkII"
so as to avoid confusion with the "stock" units also available at their
store. The rumor that Yaesu is about to replace, revise, revamp or otherwise
alter the FT-100 are simply untrue.

YAWN... thanks for spreading that rumor.

The hot rumor I have been talking up is Kenwood's new TS-2000
micro-all-band all-mode mobile which is based on the same box as the new
TM-D700A. Kenwood finally dumps the old TS-50 this year at Dayton.

Cool thing about it is the DUAL RECEIVE for cross-band operation.

Who said the restructuring wasn't going to have some interesting side
effects? :-)

2890. Different FT-100 versions

Yahoo group: FT100 (1998 — 2000)
Date: 2000-03-18 10:44:04 UTC
From: Rudolf Hooijenga
Topic: 2890 Message: 2890

About different versions, here is what I found. No idea what the Japanese characters will look like your end of the line, but the main thing is there are three versions available. The FT-100 is what we know, HF+ 6, 2, 70 with 100, 50, 20 Watts.
THen the FT-100M is for Japanese intermediate class, with 50 W on HF+6, and no 2 meters!
The FT-100S is a QRP version of the FT-100, with 20 W on 2 and 70, and only 10W on HF+6!
Just don't look at the price, it will make you weep.

2891. Power Cable Connector

Yahoo group: FT100 (1998 — 2000)
Date: 2000-03-18 14:38:36 UTC
From: K7ZO (Scott Tuthill)
Topic: 2891 Message: 2891

I wonder if anyone can recommend a Part Number and
source for the connector at the end of the Power Cable.
I have installed the cable that came with the radio
in the car, but would like to be able to run the
radio outside the car as well. Thus I need to build
a second power cable.

Thanks for your help.

Scott/K7ZO

Go to Radio Shack and buy their 20 amp MOLEX-style plug for $.99.

Install the new plug a few inches from the Yaesu plug on the battery side
(as opposed to the side closer to the radio) of the line.

The standard we all use in this area is that the DC Source gets the FEMALE
connector, and the triangle-side of the plug is wired as POSITIVE.

Works great and leaves the installation clean.

The place to go for Yaesu connectors is www.powerwerx.com

That is, of course, if you wanna stay with Yaesu direct replacement parts or maybe Powerpole connectors.

Give em a try.

Reference you request for power cable...

Try: http://www.powerwerx.com

They have the connectors for $6.50 each and are very prompt in shipment.
Stock #HF-100. You may order from the web site also.

Hope this helps.

I couldn't find anything on the net for the TS-2000. Is this for real, or is it an urban legend. While many companies could probably make something like the FT100, how many could make the ATAS100?

That said, I think waiting for Dayton to see what is released is not a bad idea.

I actually got to look at one of the Kenwood TS-2000 Transceivers at the Charlotte Hamfest on March 9th. It is basically the same size as the TM-D700. Pretty nice looking rig, but to many people around to get to play with it. I am happy with my FT-100 it dose all I need to do.

Actually, there are a LOT more people able to produce a screwdriver
antenna than a radio like the FT-100!!!

As far as the antenna goes, I have not started a rumor on the Kenwood
version of that ATAS-100... Hmmm I think it will tune 80M through 440!

Sounds good, run with that.

2900. stall the car on 40

Yahoo group: FT100 (1998 — 2000)
Date: 2000-03-19 13:52:36 UTC
From: Pres Waterman
Topic: 2900 Message: 2900

Hi. This was strange. I went into a 2000 Taurus after a few months of missing my FT-100 while in a Kia Sportage (the last successful install was an Expedition) and anyway...

I put the ATAS-100 centered in the trunk lip and had the installer ground the pigtail I added to the cable. He connected it to sheet metal in the package shelf by the high-brake light, on a panel that is well connected to the body.

Conditions are good on all bands except when I transmit on 40m the car would stall if at idle and jerk if at speed. The problem went away after a short while.

Know what I think? The battery was disconnected a bit when the power cable was hooked up. Maybe the processor went to fail-safe and was relearning how to optimize the car performance.

But there is something else I want to ask. I sent the unit back for number of nittley little things, like intermittent hi-SWR shutdown. Now, when it tunes the ATAS-100, every time it finishes tuning it displays the X-O SWR icon, just once. Then you can transmit and it doesn't come back. Now, this is only with maybe an hour of playing. Has anyone else seen this?

I don't know, it sure sounds like RF getting into the processor to me. It sounds like some of the typical reports. Remember a few years back when RF would also sometimes do funny things with ABS braking.

Of course this is like preaching to the Quire in your case Press, but I found that the documentation published by Ford to be fairly good as to how to install a two way radio without causing interference to the car's electronics. Such as not running coax next to any wiring harnesses.

From: M Johnson
Topic: 2902 Message: 2902

The April issue of QST has an ad from a company that offers an external box that will let the ATAS100 be used on other radios. From the looks of if I would say it provides manual tune buttons to raise and lower the antenna.

I would like a feature on the FT100 where you could manually tune the antenna without having to transmit. Then you could tune the antenna for peak receive when listening outside of the ham bands.

Here's something that might be of interest
http://members.aol.com/wa8lmf/ham/index.htm

Could you post the company's URL - my QST has been running late to lost for the past 3 months.

Has anyone got info on working 4 mts after doing the tx mods
What amps does the radio pull on full tx power
Will the Atas got to 4 mts?
Ive noticed the 847 tx's up there no problem

The frequency tables are integrated into the main CPU therefore they cannot be easily changed.
One would need to get a CPU with a one-time-programmable eprom on it and also have to edit the code that is written by Yaesu in order to be able to make a change.
This is just the S/W issue besides the fact that the hardware may not be designed for transmitting
on 220. Ans also: Try to change the CPU! It's a very tricky undertaking desoldering and mounting
a new one.
In the US version they use different frequency tables in the CPU compared to the european version. In the US the cellular band segment is blocked, but not in Europe. In Europe the CPU contains code for 1750 Hz tone burst for repeaters, but not so in the US model. In the US model the 5161kHz (or so) function for emergency traffic in Alaska is activated, but not in the
european model. And so on ...

I would let the car relearn all of the input (block learn) there are other terms for other makes BTW... (usually about 2 days (for an older car) or a hell run to another city if its a GM) then start fooling with the radio. Its a pretty common thing to have trouble with a (Computerized) carbed or TBI system when resetting the computer more so than SFI or Multiport. The block learn process is a sometimes long process especially if the vehicle has some miles on it or bad emissions components it has to compensate for. The radio should be as far from the computer as possible, if you still have some trouble or the vehicle stops the stalling, chances are the computer learned how to compensate for the interference by making quick changes to the block learn and storing the necessary measures. It doesnt know its interference, just how to keep the vehicle running during an episode to avoid a stall. I would shield all of the FT100's leads to the battery and move the rig to the rear of the vehicle, typically the computers are located within the passenger area while some manufacturers place them under the hood... If you need more help, drop me a line. Richy.

From: Philip Snyder
Topic: 2911 Message: 2911

Well I sent the FT100 back to Cerritos on 3-7, they received it 3-9, and it was on it's way back to me via UPS orange on the 14th. Can't say enough about the service so far. Went in for high swr icon/no output anywhere HF/VHF/UHF. According to the paperwork they replaced an IC, couple of diodes, "updated unit", and aligned it to factory specs. This is a 9E serial number. I haven't called back to see what the updates were, nothing very obvious yet.

2912. FT-100 SWR Indicator Problem on 10 MTRS / HF

Yahoo group: FT100 (1998 — 2000)
Date: 2000-03-22 03:56:42 UTC
From: Jeff Sherman
Topic: 2912 Message: 2912

Just a note on improving a Mobile HF Setup of the FT-100.

So far, I needed to do the following to get decent HF performance with the FT-100 in the mobile setup:

1. Added short grounding straps on the antenna and radio sides of the transmission line.

2. Add a short jumper (2 - 3 feet) to the already existing 10 feet of RG-8X between the radio and the HF Antenna.

3. Added ferrite snap-ons to the short 2 - 3 feet jumper and coil it through the ferrite snap ons.

4. (Not advisable) Go into the special alignment menu and increase the HF REV AGC Threshold Level so that the SWR REV Indicator wont be so sensitive. There is however a danger to this as it reduces the SWR protect of the radio..so super careful consideration of the antenna load impedence and a any overheat condition must be observed. This might even void the warranty of the unit but my opinion is that the SWR protect of this radio is too sensitive. The design needs to be improved to accommodate for different 50 ohm feedline characteristics. The worst case scenerio would be that the power devices would burn up but the Overheat Protect Circuit and fans should still help protect alittle there. Most modern day high power solid state devices can handle a open circuit condition for short period of times depending on the make and type of the devices that were designed in.

So far..no more problems. The radio performs like a real champ now!!!

That is correct, I meant to state all of the solutions in the original email but I was pressed for time, I figured that most hames would know basic interference causes and countermeasures so the list of solutions were left out. Ferrite cores are a form of rf shileding as they prevent the migration of RF along the dc lines, mic input etc.. I use a large donut on my coax with 5 turns thru it, one small one with 3 turns thru the mic cord.. You can add several along the dc line coming into the vehicle.. Thanks for adding the suggestions... Regards.. Richy

Topic: 2915 Message: 2915

I just purchased a Ft-100 and the matching FC-20 Auto antenna tuner. I was wondering if any of you are using this combination, and if you have had any problems with the tuner.

I understand that the tuner is supposed to tune a 3:1 Swr, however I am using a Hustler mast with 10,15,17 and 20 meter resonators. Using my MFJ analyser I show a 2.5 swr on 10 meters, and the tuner appears to be having a very difficult time in tunning this resonator as sometimes it will tune 10 and sometimes it won't. I also understand it is supposed to have 100 memories for quick recall. I had the other resonators tuned and saved about every 10 khz and after it has been turned off it appears it forgets the memory settings.

Has anyone else had these types of problems ? Is the FC-20 really just a dog or does it really work ok ? What types of antennas is this tuner supposed to work with, I know from reading that it is not designed to tune a radom wire, but I would think that it should tune the resonators wothout a problem.Any input would be helpful.

Thanks

73 James

I'm curious why you think you need an autotuner with a hustler mobile setup. Before I got an ATAS about a year ago, I ran Hustler coils mobile. Adjust the whip length above the coil for minimum SWR at center frequency; then check your usable bandwidth. I think you will find that you don't need a tuner.

2917. Re: [FT100] FT-100 SWR Indicator Problem on 10 MTRS / HF

Yahoo group: FT100 (1998 — 2000)
Date: 2000-03-22 17:16:09 UTC
From: ke4eg@juno.com
Topic: 2913 Message: 2917

Jeff, I have a question reference your fix for the Hi SWR indicator.

I have this problem on 10 Meters even after sending the FT-100 back to the factory for the latest updates. I have tried all the recomended fixes without much sucess so far.

On your Item 4 (Changing the HF Rev AGC), have you noted or expect to see any change in the ability to set the ATAS-100 to a low SWR using auto after making the change?

What setting was required to make your unit begin to work properly?

Tnx for any help, ke4eg

I guess I'm to literal. I envisioned you were installing coax for the power. Coax can short when it fails, so it's not a good idea.

Now the ferrites on the power supply is an interesting situation. Almost in every application of ferrites, you add the ferite so that it creates a common mode inductance. For a power supply rail, you could use a ferrite on each line, i.e. not common mode. You might want to try it both ways.

<< If you think the RF signal is finding its way along the power cables, wouldn't ferrite cores around them be better than shielding? >>

That is correct, I meant to state all of the solutions in the original email but I was pressed for time, I figured that most hames would know basic interference causes and countermeasures so the list of solutions were left out. Ferrite cores are a form of rf shileding as they prevent the migration of RF along the dc lines, mic input etc.. I use a large donut on my coax with
5 turns thru it, one small one with 3 turns thru the mic cord.. You can add several along the dc line coming into the vehicle.. Thanks for adding the suggestions... Regards.. Richy

IMHO its a dog, If you have 30 days from the seller, return it and get an AT 11 from LDG electronics.. It matches a much wider array of antennas, quicker and more reliably plus it wont tie up your data port which allows you computer control if the FC-20 is not used... Go... Go!! Now while its not too late !! :-) Regards.. Richy

Well, I can't say that I have the vast experience with it that others seem to have, by I've had my FC-20 for about 2 weeks and it performs somewhat flawlessly with my long wire. I haven't taken measurements, nor have I used the other autotuner folks are speaking of, but it does a nice job for me. I'm also impressed because it's a 'brand' tuner and is half the cost of what the usual 'brand (i.e., Yaesu, Kenwook, Icom) tuners go for. I also lucked out and got mine at a substantial discount. No problems at all with it on this end.

From: Moxon, Ed
Topic: 2861 Message: 2921

> I am trying to figure out a way to get my broken off whip out now. Any ideas would be appreciated.

Hello again John -
It bothered me that my whip was frozen in the socket, so I worked on it with a little penetrating oil and had success. While doing so, I had some further thoughts re your problem, based on a couple of tidbits of ATAS-100 geometry:
1) The black bullet-nose socket that holds the whip has a threaded base that screws into the fiberglass coil form. Under the top rim of the boot, the wire from the end of the coil gets connected to it with a hidden setscrew. So by removing the boot, you can loosen the setscrew holding the wire, then unscrew the socket from the coil form. (Note: the order here is important - and please don't ask me how I know). The holes in the socket are blind, but you could imagine drilling through from the bottom to get right at the stub and drive it out on-axis with some kind of pin. It would then be important to create a really really good seal to replace what the drill removed to keep water from getting to the insides.
2) The whip goes into the socket to a depth of 3/4 inch. Knowing that, you could drill into the side of the socket 3/4 inch down, to arrive right at the base of the stub. When the bit hits it, it might knock the piece loose. If not, at least you would have access to the base to do some prying, which ought to be better than fooling around with the side of it. With a hole in the side, the socket would still be plenty strong and it wouldn't compromise the watertightness.

OR - maybe just buy a new socket along with the new whip? Yaesu has a nice exploded view of the mechanical assembly and every little piece has a part number.

Just for balance.

The FC-20 works about as well as any 'internal' type tuner. With some playing around it will handle higher SWR levels than 3:1 and with one of the "internal tuner add-ons" from MFJ/Versatec it can match farther also. I like mine as it will tune without transmiting when going back to a previous freq.

That said, if I didn't have a tuner I would probably opt for the AT-11 also....Dean

This is incorrect, With the extensive testing I have done with the FC-20, the fact remains that it will not match or have a hard time with antennas that I could normally match with other model auto tuners. For example, if you try to match a non resonant antenna thats off by a band or two the FC-20 will usually not match it (usually) not a good word for a $200 plus dollar tuner. The tuner also ties up your data port completely eliminating computer control if desired.
Although the AT-11 uses the same method of tuning as the FC-20, the fact remains that the FC-20 is not engineered to do the job as well as an AT-11. I have tried the FC-20 mobile, at home and at other locations along with the AT-11 and I believe there is no comparison between the two in both price,product and functionality..
The only suggestion for the AT-11 that I have is to remote mount it nearest the antenna and make a control head for it near the radio. This is quite easy to do and allows full control of the tuner from the front of the vehicle The only downfall to the AT-11 is that in some radios, cpu noise is evident but LDG has inserted a sleep command to the firmware which puts this problem to bed.. No pun intended :-) Anyway, I have nothing to do with LDG and I am only a pleased customer with their product. I hardly use the thing since I run the ATAS in the car and I lent the tuner to a friend who is reluctant to give it back.. :-) Regards.. Richy

In a message dated 3/25/00 8:03:26 AM !!!First Boot!!!, FT100@onelist.com writes: << How about some details for us "Technically Deficient" types !! Tnx, Dick, W1KSZ >> Its actually quite simple, during the construction of the AT-11 (if you opt for the kit as it is available in kit or assembled with and without a case) If you build it yourself, you can add in remote jacks tied into the main switches or totally remote the unit and make a harness carrying the necessary switching components to the front of the vehicle.. You can easily just mount the tune switch in a small box and run it up to the front of the car while simply adding a small harness and plug to either the completed version or kit model. The remote tune button is needed to allow the tuner to "wake up" from sleep mode if you set it for that mode, if you suffer no cpu noise (which is slight until it sleeps anyway) you can run it in auto mode and it remains user intervention free.. THIS JUST IN!! It now has a remote head available as an option, so you technically challenged can remote the head in a snap.. Check out this site below for more info... Regards... RIGHT! What do you guys propose Yaesu do with the unsold radios built prior to last month? Crush them, or give them to the homeless? The dealers who bought them must sell them. You know, they aren't on those shelves on consignment.

Well, the tickets arrived, and it got me thinking -- is there any interest in getting a FT-100 group together at Dayton?

Some of the type of things possible...

1- Park at the remote end of Salem Mall and hang around at the end of the day. See some of those installations in 3D.
2- Hang around forum Room 1 at the end of Friday, chat, maybe organize dinner.
3- Congregate in some foodservice area Saturday, meet & greet over lunch.
4- Organize a table at the banquet Saturday.

Maybe come up with a simplex frequency to help make the casual-type gatherings work?

There's plenty of time, so please come up with comments and/or suggestions. Then when it's closer, let's see if there's any enthusiasm.

Great idea Ed. We had a small gathering last year (the rig had only been available for 2 months) and we met in the cafeteria area. We were fortunate enough to catch the attention of Yaesu, and we were privileged to meet and chat with the young man from Japan who brought the radio to market.

I'm sure the group this year will be much larger, so I don't think the lunch area would work. The Salem Mall idea is perfect, as that will give us a chance to see some actual mobile installations. Anyone else have an opinion? :)

I also will be organizing an eyeball QSO of FT-847 owners -- especially for those who are regulars on the '847 Bulletin Board (see URL below).

2936. Bi-stable frequency on 10M ??

Yahoo group: FT100 (1998 — 2000)
Date: 2000-03-29 08:45:48 UTC
From: Erwin
Topic: 2936 Message: 2936

Hi group,
Just got my Ft100 and ATAS 2 days ago and am trying to work them in. I noticed that the moble (blazer with roof port for ATAS antenna etc.)seemed to work and auto-tune well every place but 10 m. On 10M the ATAS would tune well one time and hi VSWR the next
I put the FT100 on a shack antenna (a well matched 10 M vertical used for some years)and noticed that my SWR meter was doing the same as the moble test, high and low SWR. Also RF on the coax shield, not a normal condition for this antenna. After ckecking / replacing / tighting all the coax. I went back to the old 10 m rig and found no problems with SWR etc. Finally put FT100 back on antenna with directional coupler sampling RF. A counter shows the FT 100 is bi-stable going between 28.5 Mhz (low SWR) and 13.3999 mHz(high SWR. Tryed the FT 100 on dummy loads set for 1:1, 2:1, 3:1 and its stable. That is kind of a poor trick to pull when giving no indication but flacky SWR (can be hard on the old HAM ticket). Any one seen this before????

73's and thanks for any comments

2937. ATAS-100 on 17 meters de KA6K

Yahoo group: FT100 (1998 — 2000)
Date: 2000-03-29 14:56:02 UTC
From: tomellett@aol.com
Topic: 2937 Message: 2937

Hi Gang:

Just got my new FT-100 and ATAS-100 up and running. The ATAS-100 tunes OK on all bands except 17 (one of my very favorites). It's a trunk lid installation on a Mercedes 190E. I know that the Yaesu manual says that the ant specs do not include 17 but, I'm going to try the following anyway:

(1) I've got about 1.5 Ohms between the trunk lid and the body. So will use a short strap to eliminate that.

(2) I've heard about using a short 2-3' length of RG-8 or RG-213 between the duplexer and the antenna lead. I'm using the Diamond K-400 mount with that thin teflon coax to the ATAS-100. I already have a ferrite choke on about 4-5 turns of the teflon lead.

Any other suggestions or comments are very appreciated !

Thanks and Best 73's - de KA6K Tom

Have you tried to manually fine tune it? Mine seems to tune to 17m
without problems but will have a couple of bars on the swr meter. I
can usually get a better match by manually tuning it.

I had real flaky SWR readings on 10M when I brought the rig into the house (no problems in the van). I was also getting RF back into the rig as evidenced by the power meter going all they way up while set to 5 W out! I solved it by connecting the pigtail to a dual male PL-259 plug and using NO other wire between the rig and the antenna tuner. I tried other wires of varying lengths and nothing else worked.

2946. Hgh SWR Icon

Yahoo group: FT100 (1998 — 2000)
Date: 2000-03-30 00:23:42 UTC
From: wi6l@arrl.net
Topic: 2946 Message: 2946

Not sure my last message went through. All the comments and suggestion on curing high swr Icon was a great help. I was able to cure all my high swr shut down by adding 3 feet of coaxal cable for a total of 16 feet of cable. Rig works great now. I have been haming for 25 years and I have never had to mess as much with a moble installation as I have with this Ft-100.
I am using the ATAS-100 and I am still confussed about what to set menu 61 to, is it ATAS 1 or is it ATAS 2. I am using the ATAS for HF through 6 meters and using a seperate ant. for vhf/uhf. The Yaesu Tech Service rep. said to use ATAS-1 but I thought I read in one of the earlier messages on onelist that this was not correct. Any suggestions?

According to the manual, you use ATAS-1 if you have a separate VHF/UHF
antenna, and ATAS-2 if you're using the ATAS100 for all bands (this requires
a duplexer).

If you use:

1 antenna for everything? use ATAS-1

Separate HF and VHF-UHF antennas? use ATAS-2

The manual is WRONG in one place and correct in another place. Just check it by going to VHF or UHF and press TUN for one second. In the case of separate antennas, nothing should happen. If you are using the ATAS for VHF/UHF (probably through a duplexor) then you should see the radio go into tune mode (with no transmit power though) and the antenna will screw all the way into the down position.

On page 62, the manual states that ATAS-2 is the proper setting if you want to use the ATAS100 for all bands and to use ATAS-1 with separate antennas.

On page 94, it states that ATAS-1 activates the ATAS100 on only the HF port, and ATAS-2 activates it on both the HF and UHF/VHF ports. I would interpret this to mean that if you want to use the ATAS100 as a single antenna for all bands, you should use ATAS-2.

This looks like a good subject for the FAQ when we get to the bottom of it. Whether the antenna goes up or down while pressing the tune button may not be sufficient evidence to show which setting is correct. I remember reading in this list a while ago that the DC control voltage is always sent on the HF side of the radio. I assumed this was done because duplexers typically capacitively couple the VHF/UHF side of the radio to the antenna which would block the DC control signal.

Menu 61:

The easiest way to remember the operation of the ATAS menu in your FT-100
is:

One antenna (ATAS-1 w/ duplexer): ATAS-1
Two antennas : ATAS-2.

That is odd, since Yaesu tech support told me about the misprint. I
must be lucky :-). Also had some friends who bought the same rig and
antenna before I did, they warned me about it too.

I should add that it remains in the TUN mode for quite a long time, long
enough to screw all the way down from fully extended to fully retracted.
It will not transmit, nor will it allow you to transmit during this
process. It is controlled by a timer. Crude, but effective.

The one place in the manual with the correct settings for ATAS-1 amd
ATAS-2 is pages 14-15, complete with illustrations of one versus two
antennas.

If you cannot make the antenna move up or down on HF with the manual
tune method (hold PTT, then press UP or DOWN on the front panel for at
least 1 second) then there's a problem with the ATAS or DC grounding.

The rev9907 manual looks like it fixed and consistant. Pg 14 is
ATAS#1 for one antenna, Pg62 is "ATAS 1 if -100 on all band" , Pg 92
is "ATAS 1 for both ports on 1 antenna.
Now all Yaesu has to fix is my darn radio!!

atbk-100 is designed for a balconey railing, with the railing being the counter poise for hf and the kit is for vhf/uhf ground plane.

I have one but never used it, I was planning on mounting the atas-100 in my attic but it never made it because it works so well on my truck. I wouldn't trade it for anything.

good luck

Yes. My rig developed an intermittent hi-SWR icon and refusal to transmit. Cerritos, CA Yeasu fixed it and updated the rig under warranty. Now, I notice that it always shows SWR at the end of the tuning cycle on the ATAS-100, but never again until next time I retune.

Date: 2000-03-31 13:45:57 UTC
From: Tim Ellam
Topic: 2963 Message: 2963

The ATBK 100 is NOT a counterpoise! All it does is to help your radiation pattern on VHF/UHF if you have the ATAS100 mounted on a balcony. Its also very overpriced at $CDN130.

For my base mount all I did was use a regular electrical box with a flange. The knockout at the top of the box is used to mount a SO239 barrel connector(with some big washers). The flange can be used to moun the box on a balcony or whatever and then I run 4 20' lengths of braid(picked up at Dayton last year for $5) as ground radials-it makes a nifty and effective portable setup for a fraction of the cost of the ATBK100

I have a ATBK100 for sale if anyone is interested

In a message dated 3/30/00 1:51:58 PM Mountain Standard Time, k6rcx@yahoo.com writes:

> The rev9907 manual looks like it fixed and consistant. Pg 14 is
> ATAS#1 for one antenna, Pg62 is "ATAS 1 if -100 on all band" , Pg 92
> is "ATAS 1 for both ports on 1 antenna.
> Now all Yaesu has to fix is my darn radio!!

That's not the way my manual reads which is revision 9907V-EY. Page 62 reads use ATAS-1 if you are using separate antennas for VHF/UHF and ATAS-2 if you are using the ATAS100 for all bands with a duplexer.

Page 94 which describes menu item 61 (not page 92) doesn't say anything about the number of antennas, it just says that ATAS-1 activates the ATAS100 on the HF port and ATAS-2 activates it on both ports and that an external duplexer will be required, which you can interpret as meaning that you should use that setting if you are using the ATAS100 for all bands.

So, in my manual, it looks like page 14 is correct and pages 62 and 94 are wrong. I will add this to the FAQ.

Anyone have any other reports of differences in manuals?

I added a section to the FAQ to explain the inconsistencies in the manual for the menu 61 (ATAS-1/ATAS-2) settings.

I also added the extended and retracted height of the ATAS100 antenna (56" and 63.5" respectively) under the ATAS100 section.

The FAQ can be found at:

Date: 2000-03-31 17:52:03 UTC
From: Erwin
Topic: 2956 Message: 2967

Sorry about the page error it indeed should have been Pg 94
The early post that said ATAS-1 for 1 antenna, ATAS-2 for 2 antenna
is correct per this version of the manual. Manual rev is 9907R-FY.
and it is consistent in all 3 places

Now the next Question - does the FT 100 have a problem if the ATAS
setting is left on and the radio is used on an antenna with a DC
return (a short) or does it have a current limiter on the ATAS tune
voltage ??

Hi group,
I have gone through a lot of early posts looking at high VSWR indicated and RFI problems with the FT 100. Has anyone looked at what frequency is really going up the coax when the high SWR is indicated? My radio was having intermitent high SWR indications which corresponded with a frequency counter indicating 13.999 mhz instead of 28.xxx that the display was reading. I have seen a number of posts that refer to RFI and shielding problems with the radio. I wonder if i'm seeing an oscilation problem (but the 13.999mhz appears stable). The antenna was a ATAS on the roof of a Blazer, through a well grounded thru roof port or a shack antenna very well matched at 10M. On the bench with a dummy loads it is stable for SWR from 1:1 to 3:1. In any case Yaesu has the radio, now can they fix it??

73's

Erwin K6RCX

PS - does any know if the FT 100 has a current limit on the voltage it sends to the ATAS antenna? Any problems if left in the ATAS 1 or 2 mode and connected to an antenna that has a DC return (ie short) across the feed ??

Take it off and try it on a power supply where you both can supply 8V for going in one direction and
12V for going in the other direction. Center is positive (+). If it runs then the driver unit in your radio is dead.

Oscillation at undesired frequencies when the reactance of the antenna is far from 50 ohms resistive is a Bad Thing. I wonder if Yaesu can duplicate it in the lab? If this is really occurring, they may need to modify the amplifier design to make it more stable with high-reactance loads.

The real problem that I see with the ATAS is this: The SWR sensor is located inside the rig, which has a random length of 50 ohm feedline conecting it to the antenna. The antenna impedance is variable. When the impedance of the antenna is not close to 50 ohms resistive, then the feedline starts acting like a transformer instead of feedline. This may cause false minima to show up in the SWR curve. You may be able to get a good SWR reading by manually tuning the ATAS with the UP/DOWN buttons on the front panel.

The SWR sensor should really be located at the feedpoint of the antenna, which in our case is the base of the ATAS. But that means a more complex design. Who wants to build one for me? :-) Actually that's unnecessary - I am perfectly happy with my 6 foot coax jumper that makes it work great on all bands. Good enough for Amateur Service. :-)

2977. Other mics on FT-100?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-04-02 15:18:49 UTC
From: Mark Schroder
Topic: 2977 Message: 2977

I am very interested in getting my FT-100 active on PSK-31. by jumping through a few hoops I have been able to interface my laptop with the FT-100. However, I am ready to jump through a few more to make operation easier.

Here is what I have done so far:

1) Connection from the Speaker Out (FT-100) to the Line In (Laptop) - Mono 3.5 (L&R connected together) to Stereo 3.5

2) Connection from Line Out (Laptop) to Mic in (FT-100) - Stereo 3.5 plug (only L & Common used) to voltage divider (1/100) to MIC IN on Microphone connector.

With these two cables the radio works, but I feel like a switchboard operator when I go from Rx to Tx and back to Rx.

Rx to Tx
1) Push VOX on FT-100
2) Start typing

Tx to Rx
1) Push Tx Off in software
2) Wait for carrier to stop
3) Push VOX on FT-100

What I would like to do is to activate the PTT thus handling everything from the software. I made a cable to go from the serial port on the laptop to the PTT on the DATA Jack. It works, I mean it activates the transmitter (the fans come on and the Tx/Rx light turns red) but the radio disables the Microphone when it detects a PTT signal from the DATA Jack. Heil makes an adapter cable that splits out the Microphone functions to an 8 pin connector but I have to buy their $25 adapter. HEY, WE'RE HAMS. I would like to build this setup. I figure that since the control, touch tone signals, PTT and Microphone Audio are all multiplexed into one line they must use different voltage/impedence levels. Does anyone know if this is correct and, if so, what those levels are? Or, can the DATA IN pin on the Data Jack be used for PSK data (is this only for AFSK?)

PSK31 **is** a form of AFSK. Although I have not done it, I am certain that the DATA connector on the 100 will work splendidly on PSK31. I know that I have worked numerous folks using the 100 that way on PSK31. One of the great things about the 100 is that you can use the narrow filters in AFSK. This is a premium feature which even many full-featured desktop rigs lack.

Subject: [FT100] Other mics on FT-100?

I am very interested in getting my FT-100 active on PSK-31. by jumping through a few hoops I have been able to interface my laptop with the FT-100. However, I am ready to jump through a few more to make operation easier.

Here is what I have done so far:

1) Connection from the Speaker Out (FT-100) to the Line In (Laptop) - Mono 3.5 (L&R connected together) to Stereo 3.5

2) Connection from Line Out (Laptop) to Mic in (FT-100) - Stereo 3.5 plug (only L & Common used) to voltage divider (1/100) to MIC IN on Microphone connector.

With these two cables the radio works, but I feel like a switchboard operator when I go from Rx to Tx and back to Rx.

Rx to Tx
1) Push VOX on FT-100
2) Start typing

Tx to Rx
1) Push Tx Off in software
2) Wait for carrier to stop
3) Push VOX on FT-100

What I would like to do is to activate the PTT thus handling everything from the software. I made a cable to go from the serial port on the laptop to the PTT on the DATA Jack. It works, I mean it activates the transmitter (the fans come on and the Tx/Rx light turns red) but the radio disables the Microphone when it detects a PTT signal from the DATA Jack. Heil makes an adapter cable that splits out the Microphone functions to an 8 pin connector but I have to buy their $25 adapter. HEY, WE'RE HAMS. I would like to build this setup. However, the data port for AFSK on the FT100 and any other rig that offers a AFSK mode gives you the standard AFSK frequency shift. PSK31 is a phase shift not just a frequency shift and is much narrower than the standard AFSK frequency shift. As far as I know the only way to do this is using the microphone input for the transmit input.

What PSK31 software are you using? Some software only data programs switch one of the RS-232 leads to from transmit to receive. This lead can then be connected to the PTT on your rig.

I also wonder why the vox does not do this for you? When you switch the software from TX to RX the tx input should be dropping, causing the vox to switch back to receive.

I believe that you are confusing FSK with AFSK. FSK rigs often have only one or two predetermined mark/space shifts, i.e. 170 hz, 200 hz. However, AFSK normally is shorthand for simply an SSB carrier which can be modulated by an external device, whether that be a TNC or the sound card on the rig. The external device therefore determines the characteristic of the signal. I had understood, perhaps incorrectly, that this is what the 100 features. Thus it should not be necessary to go in thru the MIC connector, which is a distinctly second rate way to do PSK31 or Pactor.

I'll also have to clarify that I haven't done it with my FT-100, but I have done it with both my FT-920 and FT-847.
Simply feed your current sound output to the mic connector over to the data audio in . You might also want to get your audio out from the data jack. On the data jack, its a fixed level output so you don't have to mess with the volume control.

On a side note; the afsk input in the data mode on the 100 has a tuning offset...much like the CW offset. i.e. when you switch from SSB to CW your center frequncy 'changes' according to the center of the modulated carrier. The USB data mode does the same thing via the RTTY offset. So, for PSK31 you will probably want to set the offset to zero. That way, when you are tuned to14.070.15 the display will actually show that frequency instead of something like 14.091.40.

I'd stay away from the Mic input if you can do it with the data jack. That's what it is designed to do. I know hams who have run PSK31 by using a rubber band around the mic to hold down the PTT and put it near the soundcard's speaker ;-). I consider most mic interfaces for data to be inconvenient because you have to make and break that connection every time you want to switch modes. Even if you use a y-cable, it's likely that the mic will pick up ambient noises in the room.

When you get this figured out, please let us know how you did it. I've been interested in adding a section in the FAQ on using the FT100 with PSK31. The FT100 has some settings in Menu item 34 to set up for RTTY (USB and LSB), 300bps Packet (USB/LSB) and 1200/9600 bps FM packet. I would think that a RTTY USB or LSB setting would work. There are also settings in Menu 35 (rtty shift) and 36 (rtty display) which probably don't make much difference for PSK31.

If anyone is already using an FT100 with PSK31, please feel free to jump in here and let us know what hardware connections you've made and how you set up the menu items associated with AFSK.

You are correct. FSK is the built in feature on a radio to do common data modes such as RTTY PACTOR AMTOR and such. On my TS-570 you can adjust the mark/space shift. AFSK is indeed a way to do FSK using SSB by using an audio signal to modulate the frequency shift.

I don't know of any rigs that have the capability to do PSK31 without using the transmit audio input on ssb.

2984. Re: ATAS 100 - newer manual

Yahoo group: FT100 (1998 — 2000)
Date: 2000-04-02 21:53:53 UTC
From: emoxon@alum.mit.edu
Topic: 2984 Message: 2984

-----Original Message-----
From: Erwin [mailto:k6rcx@...]

Now the next Question - does the FT 100 have a problem if the ATAS setting is left on and the radio is used on an antenna with a DC return (a short) or does it have a current limiter on the ATAS tune voltage ??

73's
Erwin K6RCX

Hi Erwin -

According to the schematic, the dc for running the ATAS-100 comes from a low-dropout variable voltage-regulator ic, Q7019 on the CNTL-UNIT. This chip is a Sharp PQ20VZ1, and it has foldback current limiting and internal thermal shutdown, so I would bet that it won't die easily.

I don't see much of a problem, tho. If you're on the dc-gnded antenna and just don't press TUN (or up/down manual tuning), nothing's going to happen, right? Although whenever you change the menu to set ATAS operation, it goes thru that initialization step where it tries to retract the antenna all the way to get to a known starting point, and while that's going on, you would be stressing the ic. But that wasn't what you were asking about.

Now, picking up on the ATAS-1 vs ATAS-2 topic -- the menu #61 stuff is awfully simple.

1) In ATAS-1, motor control remains available on the 2m/70cm bands. Pressing TUN puts out the down-control voltage for 2 minutes to retract it all the way.
2) In ATAS-2, the buttons don't do anything on the 2m/70cm bands. You can't get the motor to run there no matter what.

That's all there is to it as far as the menu settings are concerned. But to complete the whole picture, there are a couple of related things which are always true.

3) HF/6m is always on its own SO239, and 2m/70cm is always on its own SO239. Menus don't change this. So regardless of menu settings, you have to hook up a diplexer to combine the radio's ports when you want the single antenna setup.

4) The motor control chip is only wired to the HF/6m port (see schematic for LPF-UNIT). The menu can't change this. That's why you need dc continuity thru the HF/6m port of the diplexer.

So menu 61 has -1 and -2 backwards (at least in manual 9902n-BY), and it would be better to say "on 40m thru 70cm", not "on both antenna ports".

With these things in mind, here are some scenarios:
- If you hook the ATAS directly to the 2m/70cm SO239, you can never get it to move.
- If you hook the ATAS directly to the HF/6m SO239, on HF/6m the motor will work the same regardless of the ATAS-1 or ATAS-2 setting.
- If you hook the ATAS directly to the HF/6m SO239 and set ATAS-1, you can retract the antenna fully by going to 2m and hitting TUN (it doesn't transmit, and takes a long time to complete). It doesn't matter what you have on the 2m/70cm SO239. (If you set ATAS-2, the button just won't do anything.)
- If you use a diplexer and ATAS-1, on 2m TUN will retract the antenna and (after a while) it will end up so you can use it retracted, like the manual says.
- If you use a diplexer and ATAS-2, on 2m TUN won't do anything, so you will be using the antenna at whatever length it was left at.

I have been running separate antennas with ATAS-1. Separate antennas work no matter which ATAS selection is set.

Finally, while we're on the subject, I'll mention another tuning principle that we have discussed here before. Whenever automatic tuning via the TUN button completes successfully, then the next TUN operation will go the right direction. This is not necessarily so if you go ahead and manually tweak it, unless the last manual tweak you made happened to be that direction. If you ever find it going the wrong direction, just give it a brief manual UP or DOWN poke to establish the right direction, then hit TUN again and it will continue that way. Doing that, you don't have to wait for that long default rigamarole to turn things around.

73,
Ed, K1GGI

All the protection schemes have time lags. If the LDO is a bipolar device, you can get a localized hot spot and fry it before the protection cuts in. CMOS LDOs are better in this respect since the fets are self current limiting.

I couldn't find the Sharp web site to see the technology of this device.

And what I am saying is that you want to use your DATA for audio in rather than the MIC connector audio in pin. This is what the rig is designed for. I have done this both on the FT-1000MP and the FT-900at and it worked splendidly on PSK31.

If I can venture a guess, I suspect the chip is preventing the negative signals of the PC serial port from entering the radio, i.e. limiting them to ground potential. Very few radios (scanners) that have PC ports do true EIA232. In fact, the AOR AR3000A is the only radio I opened up that had a real 232 chip in it. The chip in the cable may limit the signal swing entering the radio as well. The 232 voltage could be as high as 15V, but most electronics does not want to see anymore than the power supply rail. If you have a scope, you could verify this by looking at the inputs versus output. Observe the signal swings and note if there are any inversions.

2994. RE: [FT100] CAT

Yahoo group: FT100 (1998 — 2000)
Date: 2000-04-03 20:15:31 UTC
From: gary
Topic: 2991 Message: 2994

I don't have a schematic, so I can't tell you what that radio uses.

Here is the deal with EIA323. The trip points on the receivers can be anywhere between -3V to +3V. In theory, for the lowest bit error rate, you would set the trip point at ground. In reality, no manufacturer does this because people like to cheat.[There is a case where negative trip points are used, but this email is already going into too much detail.] By cheating, I mean they like to drive EIA232 receivers with TTL or CMOS logic. Thus the 232 chips have their trip point set between 0 and 3V, with 1V being typical. This means a simple TTL or CMOS logic chip can drive a EIA232 receiver.

The next question is what about the reverse direction. That is, if your radio does not have a 232 chip, how do you withstand the high voltages. First of all, you can make a cheap 232 receiver with a logic gate. First, you put a 3k resistor from the DB9 (or whatever) pin to ground. Now you meet the EIA232 target input resistance. From this point, connect a high value resistor (like 50K) to a logic gate input. Diode clamp the input of the logic gate with diodes if you are paranoid, or just use the ESD protection diodes in the chip. The key to making this work is the high value series resistor. This limits the current entering the logic chip so that you don't latch it up. Also, the radio power supply has to be able to sink the current from the 232 port. The high value resistor limits this current.

Why don't the radio manufacturers just put in a Max232 style chip? One reason is cost. The 232 chip plus components would cost at least a dollar in volume, and probably closer to two dollars. The 232 chips have on-board DC/DC converters and thus make noise. The AR300A has their MAX232 on a separate PC board mounts away from the receiver guts.

The bottom line is just because you can connect a PC port to a radio, it does not mean the radio has a EIA232 transceiver in it.

The null modem is just a trick to make the PC port think the port is active.
This is needed if the port insists on hardware flow control.

No, its not. hat you are referring to would be known as a forced carrier detect, not a Null modem. The 847 is a true null-modem i.e. the 847 is a true DTE device just like a computer is...so in order for them to talk to each other, all the data and handshaking lines cross over.

From: Bryan Weaver
Topic: 2999 Message: 2999

> Subject: Other mics on FT-100?
>
> I am very interested in getting my FT-100 active on PSK-31. by jumping through a few hoops I have been able to interface my laptop with the FT-100. However, I am ready to jump through a few more to make operation easier.
> etc. ....

Use a pair of small audio transformers to isolate the rig from the radio. Build a connector to the data in & data out pins to the soundboard. You need to make a small TR switching circuit to key the FT-100, keying the PTT line on the data jack from the serial port.

I've been using this set-up for over a year & it works just fine. The FT-100 makes an excellent PSK radio. Follow the instructions for setting the levels as you would for 1200 baud packet.

Good luck.

I heard a guy at the Toledo swap ask a dealer about the TS-2000 and the
dealer pretended to not know anything about it. I heard that it's based
on the TM-D700 with a separate head and RF deck. It might have dual-watch
and do crossband repeat.

Guess we'll have to wait until Dayton.

Don't simply trust what you read in email. When in doubt, you can always
resort to reading the manual :-). On page 96, it states:

"The optional CAT interface cable CT-62 has a built-in level converter,
allowing direct connection from the rear panel ACC Cable Pigtail to the
serial port of your computer, without the need for an external RS-232C level
converter box"

It's not uncommon for tightly packaged radios, like HTs and mobiles to leave
out the level converter and provide only TTL levels for RS232.

ON A COMPLETELY UNRELATED TOPIC:

The FT847 has a level converter built into the radio, so you can use a
regular cable with null-modem wiring. The null modem simply swaps pins 2 and
3 so the TX goes to the RX and vice versa. On occasion, the swapping on pins
2 and 3 is done in the device itself so you can use a straight-through cable.
Always keep a null modem adapter handy just in case.

Yaseu Parts can get the manual for you. I would highly suggest spending
the money for an original manual as their are addendums with the new manual
that might not be included with other copies.

Their email address is: yaesuparts@...
yaesuinternational@...

3007. FT-100 Mic (not psk) help?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-04-04 16:44:09 UTC
From: Jason Baack
Topic: 3007 Message: 3007

Hello all,
I took the plunge this weekend and picked up a FT-100.
I now realize the excitement that I see in all of your messages, this radio is cool!

I do have one question that the manual does not seem to cover (which I have been reading with one hand and my ham sandwich in the other - out in my truck during lunch breaks..;-)

Can you directly enter the frequency that you want to go to from the microphone? (ex 1 4 2 8 5 - or some other combination?)
(I have the standard mic version that ships with the FT-100)

I would think that this should be able to be done, yet I am not seeing it in the manual.

The same question apply to what A,B,C,D are used for on the mic? I know about the three (4?) buttons on the bottom of the mic that you can program, but what about the rest?

Thanks --

Jay N1RWY

From: Michael Jones
Topic: 3009 Message: 3009

I just ordered one of the Powerwerx (http://www.powerwerx.com/oem-connect.html at the bottom of the page) FT-100 DC line Filters. It will probably arrive tomorrow. Their price is $49.95. I'll get it installed ASAP and let everyone know what I think of it. This will probably be a good time to finally do some pictures too.

I'm having some problems with what I think is excessive hash from my recent installataion. My FT-100 was previously in my Chevy Blazer, now I've finally gotten it installed into my Dodge Ram Quadcab. I never had a problem before, so I'm tracing things down. I've got all the materials together to start bonding all the body panels together. So, I decided to give this gizmo a try as well.

Good idea, call Yaesu directly. Or email them (dang, left the address at
home, it's probably on their website though.)

And while you're at it, you may want to make the radio aware that it is in
the USA instead of Japan (can you transmit between 146 and 148 MHz?)
There's an alignment menu you can reach by holding down A, B, and C while
powering up the rig, and you can tell the rig which country it is in
there. Warning: it will reset itself if you change the current country.

One would assume that it would be possible to use these buttons for numeric frequency input but apparently you cannot do this. The only use for the number buttons on the mic are to send the DTMF tones in FM mode while holding down the PTT. There was a discussion on this emailing list earlier about making a kit to do numerical frequency input by using an external accessory with the CAT port but I don't know if anything ever came of it.

> The same question apply to what A,B,C,D are used for on the mic? I know
> about the three (4?) buttons on the bottom of the mic that you can program,
> but what about the rest?

Those buttons do not appear to have any documented use.

>
>What's a 'grey import'?
>

A grey import is a product imported into the country other than through the official importer. It is sometimes also called a "parallel import".

The practical implications of this are that the software/ firmware/specifications of the product may be more appropriate for users in another country where the product was intended to be used, and it may be subject to an international warranty, rather than a USA warranty from the importer.

Grey market imports are often cameras, watches, and in the past, luxury cars where there were vast differences in the prices in various countries. In the 1980s, a "grey market" Mercedes was much cheaper in the USA than one bought through the USA importer and normal distribution network.

The part number of the manual changes for each revision. This number is
located beneath the barcode on the back cover of the manual. My manual is
part number E08981003. I purchased my radio in November 1999. There may be
even later revision manuals available. Incidentally, mine has the error in
it related to the description of the ATAS menu 61 settings (ATAS-1/ATAS-2).
The other date code on the manuals is the printing batch number (e.g.
9907V-EY) so it does not contain any revision information.

From: g2bww@hotmail.com
Topic: 3019 Message: 3019

Thank you everyone for the replies and suggestions.
I am following up the US distributors, who have been most helpful and I will get my manual.
Some of you raised points on the disadvantages of direct imports and prices.
I suppose the warranty support might be a problem if it comes up, but it is not always easy with a local buy, from what I have heard. Also, my old FT707 was bought the same way 20 odd years ago, and it has never missed a beat, which may give me a false sense of security.
I will let you know if it does become a problem.
On prices and savings, remember that most things in UK are very expensive. In general, the prices of Amateur equipment is the same number of GB Pounds as US Dollars, i.e. a 1000USD rig sells for 1000GBP, not around 630GBP as you might expect.
My FT100 from Japan, after UK taxes were paid, was about 10% less than the lowest advertised US dealer price on the Web. They also threw in the funny looking ATAS antenna as part of the deal. That thing works very well, even though it looks like a prop from a blue movie! This all took a bit of haggling with the man in the shop and payment in cash not credit card.
I suppose shipping costs would have made things worse, but the rig is so small it came with me as hand baggage!
Anyway, I am very pleased with the radio and the price and I look forward to the handbook to make the most of it.
Thanks again to you all, it is nice to see the Amateur spirit is not dead yet.

Things are expensive in the UK for those who live there. I've bought my AOR AR7030+ mail order from the UK for less than the best USA price, and got my options installed for free. You don't get charged all the taxes for which Europe is well known. The exchange rate is set by your credit card company.

For example at
http://www.waters-and-stanton.co.uk
>>>>>>>>>>
FT-100 160m - 70cms Transceiver GBP 849. Nobody else in Europe can beat our deal on the FT-100. With a recommended price of GBP 1295 we are able to knock a massive GBP 446 off the regular price. That's right, we are offering them at GBP 849 inclusive of UK VAT. For countries outside Europe the price is GBP 722 plus freight charge at cost. We have limited stocks so don't sit there and think about it - they may be gone by then. All are brand new UK stock with 2 year warranty for UK customers.
>>>>>>>>>>>>>>>>>>>>
The current exchange rate is 1.5971 USD per GBP, putting the radio at $1153 + shipping. The current price at Austin Amateur is $1095. The nice thing about the export version is there are no holes in the receive coverage.

Now nobody I know will throw in a free ATAS!

Hello Tom,

I use the FT-100 + CT-62 cable with TR Log with the only problem, it forces the mode to SSB. I have tried it with TR-Manager, Log-EQF and it works OK. There is nothing to set in the FT-100, you must use 4800bps as the speed setting in your program.

I wish You success

Jim, I received the FT-100 and ATAS-100 for Christmas from the XYL- I happened upon the GEOTOOL stake bed mounts and ordered 2. I have a 1996 Dodge Dakota and installed everything in that little truck with no problems. The guy who sells the antenna mounts was very helpful when I called him on the phone and talked to me for a long time. I am very pleased with the GEOTOOL Mounts and would definitely use them again. I found no problems with the antenna or rig and the distance from the cab (Approx 6') seems to make no difference- Hope you work it out-73, Mike, K4YDK

Hey Jim,
I am in the exact same boat as you.
I am looking to mount the ATAS-100 on a pocket stake mount from Geotool as well. On the geotool web site is a picture of a Ford Ranger with a stake pocket mount and a ATAS-100. Nice looking. He has it mounted on the rear passenger side pocket. There are a few detailed shots on the web site, it looks like he did a real neat job getting it on there.

Look in the file section. My installation on my Tahoe is there, garage it every night only ahve a little over 1" clearence between my roof rack and the open door. it works great with out any special prep no grounding other than the set screws on the mount and the radio is mounted on a wooden bracket and the power goes to the battery.

good luck

HI George,

I too tried to use TR with the FT100 and had the same result. Always
went to SSB mode. I discovered that if I turned the Yaesu response time
down to 10 ms then it would stay in CW mode, but then the frequency
would not readout.

I contacted Tree at TR about the problem about a month ago and he
requested that I send some information to him, which I did. Never heard
back from him. Maybe it is time to e-mail him to see how he made out.

Just thought you would like to know.

The ATAS-100 is worth considering for 40-6m. The
automatic tuning is slick -- makes it easy to surf the bands
at highway speeds. With it, plan to provide a good
counterpoise, with a real short ground to the base, and get
the whip up in the air. If you can, temporarily lash up some
different arrangements, run the ATAS up and down to
different lengths, and check what you get with a real SWR
meter before you finally commit.
I think it's fair to say that lots of posts here have advocated
a separate antenna for 2m/70cm.

This isn't a /m issue, but the IF really ought to have the
right filter for each mode, and some folks like to get the install
done by the dealer, so now might be the time. Without the
6kHz AM filter, WWV @ 10MHz can get clobbered by sw
bcst many many kHz away. The audio DSP filter works well,
but on CW, if the IF is wide, the AGC gets hit by other
strong stations anywhere in the IF passband, so you can
end up with QRM where you don't hear the CW, but you
get this wild level fluctuation that can be real tough.
500Hz works for me.

Have fun.

73,
Ed, K1GGI

As you can see I have been accused of "spamming" this list. If this is true, please excuse me and consider my posting deleted, although I don't know how to do that.
I have been posting AR8000 accessories over that egroup for the last 6 months and everyone seem glad to be able to buy items at over 50% off.

3041. Does anyone know how to fix ???

Yahoo group: FT100 (1998 — 2000)
Date: 2000-04-11 19:02:15 UTC
From: Jeff Sherman
Topic: 3041 Message: 3041

Was wondering if anyone knows how to fix the oscillation problem
on
some of the FT-100's. This occurs when you are in the SSB mode and
key
up without speaking into the microphne. You get a SWR Icon and the
radio indicates full power on the output when no signal is coming
out.
It occurs on the 6, 10 and 12 meter bands. Wasnt there when i bought
the radio but now it has bnecome a permenent problem. Antenna loads
do
not effect this problem. Am I the only one experiencing this ???

3042. FT100 oscillation problem

Yahoo group: FT100 (1998 — 2000)
Date: 2000-04-11 23:57:07 UTC
From: Erwin
Topic: 3042 Message: 3042

Jeff,
From your discription your radio has the same problem mine just went through. I put up some early posts with the problem, high VSWR indicated, 28XXX Mhz indicated on the display but output at 13.9 Mhz etc. I gave up and sent the radio back to Yaesu and worked with them to demo the problem. John Lynn, the service manager, and his team were great to work with. They got a fix, a couple of ground straps recommended by the factory to be added to the filter board, and it now works great.
Send it back!

3043. RE: FT-100 10 Meter Oscillation problem solved !!!

Yahoo group: FT100 (1998 — 2000)
Date: 2000-04-13 20:50:36 UTC
From: Jeff Sherman
Topic: 3043 Message: 3043

Thanks to Erwin on the previous posting on this problem, I was able to identify, located and fix the problem. (I noticed that the oscillation disappears when the filter board side cover was removed . There needs to be thick grounding straps added on the ground shell of the J5014 and J5014 connectors to the chassis ground on the LPF Filter
board of the radio. The straps need to be as short as possible and as thick as possible (I used 2/16 inch solderwick).The straps need to be
attached right at the "Rib" (the section cavity wall)near the connector shells (ground shell of the plug in connectors). The radio
already had a grounding strap on J5015 but it used a metal strip that was probably too long (too much inductance to ground , Acouple of NH's does make a difference !!!) . The copper tape that was used probably was losing contact to the rib thus losing a good contact to ground. If the radio is under warrenty, it is highly adviseable to have Yaesu do this fix as the circuitry in this radio is extremely delicate and can be damaged easily. I work with RF Circuit Design for a living so I personally was able to fix it myself.

The transmit section of the radio looks into the LPF filter board before it goes to the antenna outputs.The mini coax connectors that feeds these two sections need to be terminated with the proper loads between each section. If the grounding is bad on the filter board side, the transmit section sees a bad SWR which is probably causing the oscillation.

Hope this info helps some.

Hi Jeff,

My radio just started exhibiting this behaviour - it's a 9Ixxxxx serial number.

If I attach a dummy load the problem is gone. It doesn't give a problem on 6. Seems to be intermittent.

Bob

3045. FT100 repair status

Yahoo group: FT100 (1998 — 2000)
Date: 2000-04-14 16:39:33 UTC
From: Gary Mitchelson
Topic: 2919 Message: 3045

I did get my 100 back from Yaesu last week (It was a new 9D sn that had X SWR problems with a ATAS100, these problems were fixed by the extra coax and ferrite bead trick but I sent it back anyway).

Well, they did not send me a detailed list of what they did as I had requested. They just said repaired, tested to spec and brought upto latest mods.

Without the extra coax/ferrite beads the problems seem to gone. Since the ferrite fixed the problem before the fix I have left it in place after the tests just to give me some extra help.

Jim...Make sure you find that excellent ground point using copper braid if
need be. Also, if you experience the SWR Icon issue, experiment with a random
length of coax between the antenna and the radio. Have fun...I've been having
a blast with mine since May,99. Unbelievable performance from this radio!!

Jim,
I agree with Dan, make sure you run a short braid from the K-400 to the body of the car for good grounding. I have my K-400 on the rear hatch of both of my Ford Explorers and with the short braid, I have NO problems. I know about the supposed fuel pump noise in the Fords, but it hasn't proven to be a problem for me with our Explorers(a '91 and a '98). I love this radio, especially with the ATAS-100. Great combo.

Have fun!

Hi Gang:

Does anyone have experience with the FC-20 and ATAS-100 combination?
I am considering getting the FC-20 to tune my ATAS-100. At the
present, I'm not able to tune the ATAS-100 on 17M and some parts of
20M. I think it's the fact that I've got a limited ground plane from
my small Mercedes 190, trunk lid installation.

Anyone had success with the FC-20 in a mobile installation like mine?

Any comments or recommendations are very much appreciated!

Most likely, its not a matter of ground plane, its a matter of counterpoise. The design of the ATAS is such that it doesn't require a ground plane for HF, but it does require a counterpoise. The counterpoise being...the 'other' half of the antenna.

I would recommend running a heavy braid groundstrap from the trunklid to the frame. Make it as short as possible; or in a couple hops (like from the lid to the quarter panel, then from the quarter panel to the frame)

Once you've done that I would suspect that the most you should have to do for 12m/17m is touchup the tune with the manual-tune up/down buttons.

Mike

The FC20 in conjunction with the ATAS-100 does not seem like a workable combination. The ATAS/TUNER menu item allows you to select one or the other, but not both. If you have the FC20 inline, it's unlikely that it will pass the DC signals that allow the antenna to extend and retract. I had a problem with high SWR on 10m that I moved to 15/17M by adding 6' of cable in the feedline. When I reduced it to 3', I was able to tune on all bands. Try some coax jumpers to vary the length of the feedline to see if you can make the problem move or go away completely. The best length of feedline for my installation has turned out to be 19 feet. That includes the 6' teflon coax that comes with the Diamond K400 mount, a 10' RG8X extender also from Diamond, and a 3' RG8X jumper.

I'm completely lost in regards to the FT-100 antenna issue. I ordered an FT-100 last week (it should be in on Monday), and I plan on using HamSticks on 80, 40, and 20 until I get a new vehicle (in the next couple of months). What are my options in regards to autotune antennas? I don't look forward to having to pull over and either swap or tune antennas driving down the road, but an antenna tuner is a significant investment, and I don't want to make the wrong choice.

Also, thanks to the list for firming up my decision to purchase an FT-100 - I ahd eliminated the TS-50 early on, and the decision was really between the 706 and the 100, since they are similar in many ways.

Tom forget running them together, it will not work correctly. If you use
the ATAS it will be all you need in one package. The FC-20 is IMHO not worthy
of the Yaesu name. It has a very narrow window of tuning "out of band"
antennas. I recommend the AT-11 by LDG in MD. It is cheaper, works better and
although it uses the same design practice, its able to do a much better Job
tuning.. If you have the ATAS, believe it or not it will be all you need for
mobile ops.. Regards.. Richy

Seems like a few more are opting for some other antenna system than the ATAS.
Take a look at the Hustler Vertical with the 4 antenna mounting plate at the top.
Works great and you don't need to change coils or tune antennas. Sure you are limited to 4 bands, but it works.
As a plus, the mast resonates on 6 so you can also work 6 mtr FM/SSB.
I worked a W8 in Ohio while mobile in Mass. Just my 2 c worth.

What are the reason someone would use an electronic antenna tuner over the ATAS100?

My educated guesses are:
1) The atas100 is heavy. Some may not want to put this beast on their vehicles, especially if they drive fast.
2) The atas100 has a hole some place in the ham bands where it can't be tuned
3) A whip plus tuner puts more "metal" out in the air. Even if your antenna is tuned, the more wire you have out there, the better the performance will be.
4) Reliability.

All this makes me wonder why the Isoloop has left the ham scene. I've listened to hams driving around with the loop and they put out a serious signal.

Hi Gang:

Does anyone have experience with the FC-20 and ATAS-100 combination? I am considering getting the FC-20 to tune my ATAS-100. At the present, I'm not able to tune the ATAS-100 on 17M and some parts of 20M. I think it's the fact that I've got a limited ground plane from my small Mercedes 190, trunk lid installation.

Anyone had success with the FC-20 in a mobile installation like mine?

Any comments or recommendations are very much appreciated!

Best 73's to all,

Tom Ellett - KA6K >>

Tom forget running them together, it will not work correctly. If you use the ATAS it will be all you need in one package. The FC-20 is IMHO not worthy
of the Yaesu name. It has a very narrow window of tuning "out of band" antennas. I recommend the AT-11 by LDG in MD. It is cheaper, works better

and
although it uses the same design practice, its able to do a much better Job tuning.. If you have the ATAS, believe it or not it will be all you need for mobile ops.. Regards.. Richy

From: Charles Scott
Topic: 3061 Message: 3063

Another option is the LDG AT-11 Tuner. While I haven't used it with my FT-100 I have receintly with the IC-706 in my wife's van. In any case it would be a similar situation.
I first tried it with a 102" whip and it tuned fine from 20M on up. Worked OK on 40M, but not great. Using the helicaly wound whip that came with the SGC tuner I have on my truck (the SGC is the tuner that I'm using on my FT-100), it was able to tune fine from 40M on up and sort of on 75M. I used it on our trip to Texas a few weeks ago and had real good success working numerous countries and regularly back home to MI. I beat the tuner up pretty hard and it never had a problem. Maximum tune time was about 10 seconds.
Considering the low price of the AT-11 (less than $200), I think it's a good choice. Even if you buy a 40 Meter Ham Stick to use when tuning the lower bands, it's still a pretty cheap option relative to the ATAS. You will however need a UHF/VHF dual band, which is probably a good idea over the ATAS anyway.

I cannot detect the that ATAS100 slows me down, although I can agree that it
does have more wind load than a simple whip.

> 2) The atas100 has a hole some place in the ham bands where it can't be
> tuned

Most installations are able to tune over the complete range ham bands
including WARC bands. There certainly have been a lot of folks, myself
included, who have struggled with installation issues where complete bands
are rendered useless until the installation problems are worked out.

> 3) A whip plus tuner puts more "metal" out in the air. Even if your antenna
> is tuned, the more wire you have out there, the better the performance will
> be.

My ATAS has enough metal in the air that I can barely fit it in my garage.
Any more would be too much. I've worked literally around the world on the
ATAS100 with excellent signal reports, and it has at times outperformed my
G5RV which has 102' of 'metal in the air.'

> 4) Reliability.

Anything with moving mechanical parts will be subject to wear and eventual
failure. Even stationary mobile antennas can become corroded and rendered
inoperative. Autotuners have moving mechanical parts in them. Some have
motorized coils, others have switching relays. The wear issues are there
whether you're using an autotuner or ATAS100. Also, operating any tuner that
requires you to be switching modes, changing power settings, sending out
carriers, or monitoring an SWR meter is dangerous to be using while driving
along in your vehicle. The ATAS100 requires a single press of a button.

Most autotuners that are factory supplied are limited to 3:1 SWR mismatches.
If you had an antenna that fit that description, it would be advertised as
being 'resonant on all bands' and you could probably get by without a tuner.
The LDG Electronics AT11 does a little better (up to a 6:1 max mismatch), but
a whip isn't going to even be that good on every band.

I honestly can't think of a better solution for a mobile antenna than the ATAS100, installation problems notwithstanding.

First I hope no one thinks I'm being critical of the FT100 or ATAS100. I'm just looking into all aspect before I purchase. To be honest, I'm even waiting to see how this new Kenwood Ts2000 (#?) turns out.

I worry about putting something as heavy as the ATAS100 on a SUV where the vehicle is going to get jostled around.

I noticed that the AEA isoloop is no where to be found, but mighty fine junk (MFJ) is selling three similar models: papa bear (MFJ1788), mama bear (MFJ1786), and baby bear (MFJ1780). Now the MFJ1788 covers 40 to 15 meters, the MFJ1786 covers 10Mhz to 30Mhz, and the MFJ1780 covers 14 to 30Mhz. In order of size, they run 4ft, 3ft and 2ft in diameter. Now bearing in mind I don't have my HF privileges yet (but will do so soon), so all I know about the bands has been from listening. Now I can certainly give up the 40 meter band since there seems to be lots of short wave broadcasts nearby polluting the band. I know little about the 30 meter band, but the 3ft loop would cover it. Thus a 3ft loop would cover all the really useful ham band (except the very popular 80 meters band), and perhaps a smaller loop would be just as good.

Now my point is you can (or perhaps "can you") use a roof rack to mount the loop on top of the truck, yet still have a very low profile setup. The advantage to the loop is that the only mechanical component (other than the motor) is the variable capacitor, which need no sliding contacts to corrode. The disadvantage is the unit isn't plug and play.

From: Jim Balls
Topic: 3067 Message: 3067

Hi all.
I've been playing with a friends FT100 for a couple of days and i'm very impressed, so much so I'm going to purchase one for mobile use.
I already have a Homebrew DK3 Screwdriver but i'd love to automate it with the FT100.
I'm sure if I could find out whats inside the ATAS100 on the control board for the motor it could be done. I plan to switch relays with the control board so no load wouls actuall be on it.
Can anyone out there help me?
A Circuit Diagram and Component list would be realy helpfull.

Thanks

Jim M0CKE

Gary:
For what it's worth, I ended up just using an SGC tuner and a stainless CB whip on my Hummer. I take that thing through the trees pretty often and realized right away that nothing else was going to survive. (I've already destroyed a dual-band antenna that was mounted up there and have had to repair my 2 Meter colinear a few times.) Needless to say, if I destroy the CB whip the replacents are cheap!

In-Reply-To: <memo.409484@...>

One of the dealers here in the UK has started advertising "NEW !! FT-100 mkII" in the magazines. There's nothing on their WWW site though, or indeed any other WWW site. This dealer is normally very quick off the mark with news etc.

Prices on the FT100 have been slashed currently ?450 off the RRP, so using todays rate they're down to less than US$ 1300. Don't know how that compares to the USA.

The price slash would indicate to me that IF there is a new version in the pipe-line, then the Mk 1 is not upgradable :-(

There again, others say the price slash is just to compete with the Icom 706 which now comes with a FREE quad band hand-held.

Don't know who to believe..., which is why I asked here if anyone knew about the Mk II

Gary, it's too early to address all of your message, but I can say that I have tested the atas100 with a diamond k400 mobile mount, attached to the trunk lid of a ford tbird at 90mph for extended periods. It's going to depend on what you have to hook it up to in terms of the strength of body panels, but no problems at all on the installation here.

Even if your budget isn't limited, who would want to waste money? You wouldn't want to go through the hassle of installing a radio then pulling it out, installing a new radio, and dumping the clunker on ebay.

All the rumors will be over after Dayton. Kenwood has a reputation of delivering products that don't need revs in production. [The TH79 versus TH79A was not a bug, but rather a missing feature. That is, you could looks at the feature list and see the original couldn't scan.] Yaesu makes great products, but has a reputation for delivering products that need tweaks in production. [I bought a FT51, but only after it was out for 18 months. I avoided many bugs. The VX5 was very flawed when it first came out as well and still doesn't work very well. It has the worst CTCSS ever made.] Anyway, if the TS2000 looks good AND you are not intending to use the ATAS100, it is a reasonable option.

I have a SUV arriving in two weeks. I really can't fathom how to mount the ATAS100 and have the thing garage-able. I looked at the ladder mount and thought that was sturdy, but I'm not getting a van! So much of the ATAS100 is motor, i.e. not metal in the air.

I still think the Mighty Fine Junk (MFJ) isoloop is the way to go. Of course, unlike the MFJ of old, the isoloop costs real money.

Can the mobile HF crowd live with 14Mhz to 30Mhz coverage of the 2ft isoloop.

BTW, I believe the FT100MKII was the standard FT100 with the high stability VCO. It is marketing. The bottom line is to wait for Dayton.

Too many people ignore the fact that in a "center" loaded vertical such as the ATAS 100 the portion with the highest current (and the highest radiation per inch of metal) is the part BELOW the loading coil. That's one reason why it's so important to get that part of the antenna up as high as possible and away from surrounding metal. So it surely is not just motor, but actually an important part of the "metal in the air".

At the risk of sounding picky, the problem with the TH79A was that it
didn't have a channel lockout feature, which for a radio with some 80
memory channels was a major problem. Their sales brochures stated that it
DID have the channel lockout feature. The biggest problem was that when
they released the TH79A, they called it a "new" radio (despite the fact
that the only changes were the lockout feature and a different antenna)
and they flatly refused to make any consideration to the owners of the
original TH79. Kenwood let that one come down to the day I was filing a
law suit against them before accomodating me. Worse yet was the way I was
treated through that process. Hopefully they are a reborn company now, but
I'm going to wait till I hear glowing reports from customers. Too bad,
because I think they have always, and continue to, make good and creative
equipment. Anyone can screw up. What's important is how they handle it
when they do.
You may also want to talk to some of the earlier 850/950 customers about
early production problems with Kenwood products.

Again, while the VX5 isn't a perfect radio, it's very novel and in
general works great--certainly NOT a "very flawed" radio. I replaced my
FT-51R (which I thought was a great radio) with a VX5 and have now bought
another for my wife. I'm glad I did and am happy with the support from
Yaesu on corrections. The only real lingering issue is a sluggish PL
decode, which is bearable (to call it the worst CTCSS ever made is really
a stretch).

You may really want to consider a tuner such as the Yaesu, SGC or LDG's and a whip or loaded whip. Since you can use a quick disconnect fitting on a whip, one of the fold over adapters for the standard thread mounts, or even a spring with a clip for the top of the antenna, it's probably workable for your SUV and garage. The biggest advantage with whips on an SUV, rather than something like a screwdriver or ATAS type antenna is that it's more likely to survive abuse. That of course assumes you plan on taking your SUV off road at all.

> I still think the Mighty Fine Junk (MFJ) isoloop is the way to go. Of

Operationally I think it's a very good option. For that matter, so is an untuned loop and a tuner (see SGC for examples). The problem is that loops are much more likely to catch things like branches and sustain dammage unless they're really built well.

> BTW, I believe the FT100MKII was the standard FT100 with the high stability
> VCO. It is marketing. The bottom line is to wait for Dayton.

This makes sence and now that you mention it I think I've heard this before. I will however be making the rounds at Dayton to see what's coming out.

Not to harp of the VX5, but the damn thing get too hot to hold. I predict it will be the first and last metal cased HT. The mic has a funny sound to it as well, like their is feedback. The advantage is it is relatively cheap since you don't need to add a CTCSS board like the FT50.

I don't recall the lockout on the TH79 being advertised when it came out. In any event, I had some friends who gladly picked up the plain TH79 at a big discount, because they scan with scanners and talk with HTs.

Getting back to the FT100, I was think of mounting the isoloop horizontally using roof carrier racks. This operation is shown in the ARRL antenna handbook. I need to see if MFJ approves. I also need to have my head examined for buying something expensive from MFJ. I'm accustomed to MFJ being a schlock company, but remember Yaesu was a schlock company a decade ago, at least regarding their HTs. I swore I'd never buy yaesu, but the quality improved and I bought a FT50. I used to believe Icom was the pinnacle, but my present and probably last Icom (the 2700) is a piece of junk. A friends identical unit is flaky as well. The voice synthesizer sure makes a neat cross band repeater, which is where the unit will find it's home. The controls on it are now flaky. What is annoying is that I rarely used the hand controls since it has a fancy microphone, so I can't understand the knobs (encoders) getting worn out.

My Kenwood gear hasn't been perfect either, but I will say they are very friendly to those who repair their own gear. I replaced two encoders on a TH78 and got some tips from one of their techs in LA on doing the repair.

It is always best to wait for the user reviews, then go play with the box to get a look and feel. The FT100 knobs and such seem to work well. Has anyone had a button or knob flake out yet?

I guess it's all about where you'd like the heat to go. A 5W HT will
generate a certain amount of heat. The smaller it is, the more
concentrated the heat distribution. My guess is that if HT's keep getting
smaller, pretty soon they'll have to start using the antenna for heat
dissipation.

>

Yep, it's in the original ads and brochures--I have a copy. No question
about it, picking up one of the TH79's from a disgruntled owner was a
great deal for someone who didn't need to scan a bunch of channels.

> My Kenwood gear hasn't been perfect either, but I will say they are very

Agreed, I never really had a problem with the service techs at Kenwood.
The one thing that is annoying however is them farming out their parts
sales. That can make it harder to get the right parts or at least may
result in an extra call or two.

> It is always best to wait for the user reviews, then go play with the box to

All I can say about that is look at the original FT100 reviews,
particularly the one in QST. The problem is that reviews aren't always
written by people doing comprehensive testing or patient enough to fully
understand the operation of the radio.
No problems with knobs or controls. The only two such problems I've run
across with Yaesu products is on the FT-8100R, which has a problem with
the surface mount connectors to the control modules, and my old FT-736R,
which has a marginal selector knob encoder as some owners have run into.
All other controls have survived my normal level of abuse without failure.

i have a FT530 and it is a metal case HT. It gets hot but then what do you expect? Get a fan to put on it and don't key up more than 5 minutes at a time. HT's are not 100% duty cycle, unless on the lowest power setting(even then it is questionable).

i have operated mine in the crossband repeat mode on low power and it works great, even after 6 hours of crossband repeating. i have a lot of luck with yaesu. infact i just sent my FT-530 in to yaesu to do a overall alinement and replace the case, BOY what a differance a good tune up will do. i do have a FT-51R but it dont have as good of a reciever as the 530, but i am going to send it to yaesu for an alinement, and get them to remove the mod the privious owner did to make it TX out of band.

Subject: RE: [FT100] FT-100 MKII ??

Not to harp of the VX5, but the damn thing get too hot to hold. I predict it
will be the first and last metal cased HT. The mic has a funny sound to it as well, like their is feedback. The advantage is it is relatively cheap since you don't need to add a CTCSS board like the FT50.

I don't recall the lockout on the TH79 being advertised when it came out. In
any event, I had some friends who gladly picked up the plain TH79 at a big discount, because they scan with scanners and talk with HTs.

Getting back to the FT100, I was think of mounting the isoloop horizontally
using roof carrier racks. This operation is shown in the ARRL antenna handbook. I need to see if MFJ approves. I also need to have my head examined for buying something expensive from MFJ. I'm accustomed to MFJ being a schlock company, but remember Yaesu was a schlock company a decade ago, at least regarding their HTs. I swore I'd never buy yaesu, but the quality improved and I bought a FT50. I used to believe Icom was the pinnacle, but my present and probably last Icom (the 2700) is a piece of junk. A friends identical unit is flaky as well. The voice synthesizer sure
makes a neat cross band repeater, which is where the unit will find it's home. The controls on it are now flaky. What is annoying is that I rarely used the hand controls since it has a fancy microphone, so I can't understand the knobs (encoders) getting worn out.

My Kenwood gear hasn't been perfect either, but I will say they are very friendly to those who repair their own gear. I replaced two encoders on a TH78 and got some tips from one of their techs in LA on doing the repair.

It is always best to wait for the user reviews, then go play with the box to
get a look and feel. The FT100 knobs and such seem to work well. Has anyone
had a button or knob flake out yet?

Tom

I'm with you. The FT-530 is the best HT ever made. The HT's have gone "downhill" since the FT-530. One of it's best feature is the Great BACKLIGHT and easy to read display for us not blessed with perfect vision anymore. I have not found anything that this HT couldn't do well. From long life batteries to true dual band operation.

I currently have 4 of them (down from 5) and have been temped to get a few more as they are very inexpensive on ebay.

73, ken

I'm straining my brain here, but didn't the FT530 have that cool feature where you could decode DTMF?

Sorry to digress from the FT100 topic.

BTW, my FT50 is the export model. No mods needed. Bander.com was blowing them out at a bit over $200, but you didn't get the nicad pack or wall wart. My old boss had the nicad pack and wall wart, but used the alkaline pack, so I got the wart and pack for $20.

You can do the same export deal with the FT100 IF you believe you won't need warranty service.

The FCC doesn't care. The FCC sells spectrum and occasionally fines jammers.
If you are causing interference, maybe they will seek you out.

The FCC really hates leaky cable companies. They fly over big cities looking
for hot spots. That's about the limit of their enforcement.

While the DTMF squelch is cool, I understand you can snatch the DTMF tones
going over the channels. The FBI used to adjust their surveillance cameras
with DTMF, but I haven't heard that done in years. However, knowing the
codes would of been fun...

Hello Jim
Here is my solution to controlling my bandhopper, using my FT100. The only problem for me is that the ft100 will not tune 75. If 40 through 10 is what you want this will work. Also included is auto capacitor switching for the various bands. My bandhopper uses caps to resonate instead of a torrid. good luck

Hi again Ralph .. thanks for the explanation .. it sorta makes sense now,
so you just use capacitors on the bandswitch data relays?
I willl try to build one as soon as I can pending the price and supply of
the board needed from Yaesu
Please take a look at this drawing and see if this would work .. ie without
bandswitch data and capacitors.

3096. Magnet mount and ATAS-100

Yahoo group: FT100 (1998 — 2000)
Date: 2000-04-18 07:25:54 UTC
From: Red Hat Linux User
Topic: 3096 Message: 3096

I tried a few CB antennas from RS with my FT-100. The efficiency was poor and I had to add a few ferrite beads to avoid seeing the Hi SWR icon. Last week I picked up a 3-magnet mount and hamsticks. Great efficiency in comparison and no SWR problem. I think it is not only increased antenna lenght but also increased capacitance of the magnet to the body of the car and thus better grounding. Still, trips to screw and change hamsticks take time.

I am wondering whether somebody has tried installing ATAS-100 on such a magnet mount. It has only a 3/8 inch thread, but adding an extra socket should not be hard. Another issue is how to avoid paint scratches. The mount has plastic protecive covers, but when the magnet is removed it makes an edge contact with the paint.

Seems like a few more are opting for some other antenna system than the ATAS.
Take a look at the Hustler Vertical with the 4 antenna mounting plate at the top.
Works great and you don't need to change coils or tune antennas. Sure you are
limited to 4 bands, but it works.
As a plus, the mast resonates on 6 so you can also work 6 mtr FM/SSB.
I worked a W8 in Ohio while mobile in Mass. Just my 2 c worth.

Hi Mike:

Thanks for the note on the ATAS-100. I will use some 1 1/2" copper braid ground strap to bond to the frame. I'll do it in two jumps. one from the trunk lid to the rear quarter panel and another to the frame. I'm sure you are right, that's why the ATAS-100 is not tuning well. It's got a fare ground plane but not enough counterpoise!

I have found that the Merecdes panels are so well primed and painted that I've got to drill a hole, sand to bear metal, and use a sheetmetal screw with a star warsher to get a good connection. I'm also using RTV to seal by braids and connections.

Many thanks Again Mike and take care,

Tom Ellett - KA6K ==> KA6K@...

3099. Bonding the ATAS-100 to the Frame

Yahoo group: FT100 (1998 — 2000)
Date: 2000-04-18 16:34:59 UTC
From: aschach3@csc.com
Topic: 3099 Message: 3099

Hello all,

I am looking to improve the grounding of my ATAS-100 on my 1995 Mercury Sable. I have the FT-100 installed in the trunk and both the trunk lid and FT-100 are grounded to the frame. I am not able to achieve an acceptable SWR (the old HI SWR icon problem) on 6/10/12 and am not yet comfortable that the Diamond K-400C antenna mount is grounded as well as can be to the trunk lid.

I've put a torroid on the coax at the base of the antenna and tried adding a 5' length of RG-8 with moderate success. Resistance from the base of the antenna to the chassis is about 0.2 ohms.

Does anybody have any suggestions?

William:
The multi-resonator adapter for the Hustler antennas is I belive the VP-1, which sells for less than $10. I can't find any pictures of it, but there's an antenna that looks remotely similar at the following URL.

http://www.spiderantenna.com/info.html#4band

If you can imagine something similar to that, but on a Hustler mast with Hustler resonators, you'll have the idea. It is however a rather unsightly arrangement (at least to mobile use), although I have in the past used such a beast. In fact I even had one of the spider antennas quite some time ago (at least I think it was the spider). It's demise came as I installed an MA-1000B amplifier. (I can still smell it.)

I pulled back the "capeting" inside the trunk, drilled a hole and sanded away the paint. Since the bare metal is fully inside the trunk I'm not too concerned. Hopefully, old man Murphy will leave me alone!!

I found that grounding the K400 had very little effect one way or the other on my high SWR problem. The same goes for the rig itself. I know this is heresy, but others have reported similar results with grounding experiments. Ferrites did nothing for me either. There are some folks successfully using the ATAS100 with no grounding other than what is provided through the negative power lead. I tested the ATAS tuned for 10m using an SWR analyzer and it showed a very low SWR even when the radio was complaining about high SWR. I confirmed that when I disconnected the ATAS from the K400 mount and moved it away from the car body, the SWR became terrible. Then I moved it closer to the body and just the capacitive coupling through my hand to the paint provided a low SWR on the meter.

In any event, the external SWR meter and one on the rig were in perfect agreement with each other until I transmitted. I was always able to tune the antenna with few problems, but the SWR icon would begin to act up when I transmitted.

The only solution that worked for me was to adjust the length of the feedline until it was 19 feet overall. Prior to that, I had an overall length of 16'. When I increase it to 22' and it only moved the 10M high SWR problem to 15 and 17M.

Others have been able to get the problem corrected by sending the rig back to the factory for some modifications.

Tom KD4WOV and the members of the onelist. I have completed my testing of the 102" whip on the back of my van. The whip is mounted on a bracket which is at the top of the left rear door. The base of the antenna is about 6' above the pavement. From the connect and bracket I ran 20' of RG8x to the LDG AT11MP, & 1' of RG8x to the FT100.

10 mtrs no problem tunes in less than 2 seconds
12 mtrs no problems
15 mtrs tuning starting to take about 3-4 seconds
17 mtrs same as 15 mtrs
20 mtrs tuning takes about 4 seconds
30 mtrs it seemed to not want to find resonance, but eventually it did
40 mtrs hmmmmm, it took several attempts to get close to 2:1
75 mtrs HA!!!!! no way Jose!

Driving around I hit some tree branches, but the whip is still OK, I am disappointed it didn't work out on 40 :-(

Good analysis, Lee. I wonder if the issue might be RF pickup on the feedline while you are transmitting, getting back into the rig. Has anyone tried serious ferrite AT THE RIG end of the coax?

I've tried the snap-on type ferrite with 5-6 turns at the antenna end and also at the rig end of the coax without much noticable difference. Do you have any recommendation as to what other type of ferrite to try?

I have also noticed lately that the FT-100 has trouble tuning up on 15/17 and I have to jump from band edge to band edge, sometimes more than once, and retune before the SWR can be brought down.

I had previously sent the ATAS-100 in for repairs and Yaesu replaced the IC but it made no difference whatsoever. I still cannot tune up on 10/12 and 6m is flakey. Is it time to send both the rig and antenna back to Cerritos again for them to look at it? That will put a dent in my trying to work DXCC from the car this year. :-(

From: emoxon@alum.mit.edu
Topic: 3109 Message: 3109

>From: "gary" <gsellani@...>
>Has anyone had a button or knob flake out yet?

Yep. After abt 1 year, my Select Knob encoder goes the wrong direction quite a bit. The encoder on my FT-51 also.

>From: "Jeff Sherman" <k7xq@...>
>Subject: RE: FT-100 10 Meter Oscillation problem solved !!! .
>
>There needs to be thick grounding straps added on the ground shell of
>the J5014 and J5014 connectors to the chassis ground on the LPF
>Filter board of the radio.

I have occasionally had the ATAS tuning problem that is affected by coax length. I had noticed that the power during the weird tuning would be like 50 watts, which is way off, but I never looked at the frequency like Erwin did (3/30 posting). Last weekend I was rearranging the installation and ran into the problem. I could change things by squeezing the covers. Knowing what Erwin and Jeff had just recently posted, I opened it up and found that I already had decent-looking straps on both connectors (5014,5015), running to copper tape folded over the casting rib. The radio had been to Cerritos last October for the no-tx-on-hf problem, and maybe it got the straps then?? One of the pieces of tape (for J5014, V/U PA) was mostly floating away from the rib, especially where it had been stiffened by solder. Anyway, I used a couple of "mini binder clips" (the real springy blue-black paper clamp things with the triangular cross-section and shiny squeeze levers) to clamp the tape to the rib, and things were fine (this was on the low end of 40 and 15). I have since tried to get back to the bad condx by fiddling with the straps, but I haven't been able to. As of now, I have the clips in place (with their squeeze levers taken off). I'm not 100% sure that I have been working on the real problem (problemS?) though. There is a lot of other copper tape that is supposed to help the covers make contact with the casting, and this could be another variable.

So to folks who have good ATAS grounds but still need to fiddle with coax length -- wonder if you have the straps and if they're in good shape?
(If you are curious enough to take off the top cover, try not to yank on the speaker leads.)

From previous posts, I recall the ferrites didn't help but the extra coax did help. The confusing thing is the coax length isn't significant relative to the band of operation. This makes me wonder if some harmonics are feeding back (rather than the fundamental). On miniaturized transceivers, the first thing that gets the axe are large passive filters. Anyway, has anyone tried to coil the extra coax as is used in CABs (cheap ass baluns)?

You will need about 20 - 25 feet. Plus some type 68 ferrite cores (about 6" worth) at the radio end makes a world of difference.

John/Tom:
This data mirrors my experience with the AT11 on a 102" whip. The solution for me was to put on a whip I had made by SGC. It's a helically wound whip that was designed for use with their tuners. I'm sure that if you try some of the fiberglass whips that have some loading (or better yet, rewind one so that the windings are evenly distributed) you'll do well down to 40 Meters.

The FT82-68 ferrite core from Amidon is approximately ¼" thick. Do you really have two dozen of these on your coax?

You will need about 20 - 25 feet. Plus some type 68 ferrite cores (about 6" worth) at the radio end makes a world of difference.

I'll certainly try coiling up the extra coax. The rig is in the trunk and only
3' or so of the coax is really required.

cc: (bcc: Abe Schachter/DEF/CSC)
Subject: RE: [FT100] Bonding the ATAS-100 to the Frame

From previous posts, I recall the ferrites didn't help but the extra coax did help. The confusing thing is the coax length isn't significant relative
to the band of operation. This makes me wonder if some harmonics are feeding
back (rather than the fundamental). On miniaturized transceivers, the first
thing that gets the axe are large passive filters. Anyway, has anyone tried
to coil the extra coax as is used in CABs (cheap ass baluns)?

Is this something peculiar to the FT100, or in generally do mobile HF rigs need some coax isolation.

In theory, the endpoints of the antenna have no radiation, so having the receiver right under the antenna should be the best possible case. This make me wonder if the loading coil (or whatever is in the ATAS100 guts) is radiating.

Gary:
This is not exactly true. If you're talking about the top of an antenna, it's a voltage node and there is radiation from that. If you're talking about the feedpoint, it depends on the type of antenna, but there is usually significant radiation from that point. In any case, it's difficult to predict exactly where you're going to have high field densities in a vehicle and that will vary with frequency.
There are two ways you can run into problems with stray RF in mobile installations. One is the way the antenna is mounted and grounded. The idea is to keep as much of the RF outside of the vehicle as possible. The best situation is to use some kind of a feed-through mount so that no part of the radiator is exposed inside the vehicle, the shield of the cable is grounded right at the antenna base and the transmission line is not directly exposed to the immediate field of the antenna. In such a case, you will have minimal RF comming back on the outside of the transmission line and therefore less RF inside the vehicle and near the radio's mic, power and speaker lines. Less desireable situations are where the shield of the transmission line is not grounded right at the feed point of the antenna or where the transmission line is actually exposed to the immediate field. One example of a potential problem is a bumper mount antenna with the transmission line running back up past part of the atenna and into the trunk.
Mounts like magnet mounts, despite the fact that they have capacitance to the metal their stuck to, do not have a perfect ground at the base, and therefore there will always be some rf comming back down the transmission line, which is also unavoidably going to be exposed the the immediate field. In such a case, it's adviseable to ground the shield of the cable right were it enters the vehicle. Also, ground straps that wrap around and back into the inside of the trunk or vehicle and terminate to the inside of the body introduce additional RF into the inside of the vehicle.
The other problem is that it's impossible to be very far from your antenna in a vehicle. Unless the car represents a complete shield, which most don't due to windows, doors, plastic and such, you're always going to have some significant levels of RF inside. As a result, you'll always have some RF getting into the power, speaker and mic lines of your radio. Some

are well bypassed and aren't susceptable to this, some radios don't like this at all, and the rest are somewhere inbetween. The only way to solve this problem is to install bypassing on those inputs or chokes on the lines just outside the radio.
I don't think the FT-100 is much worse in this respect than most radios. In my truck I haven't had to put on any extra filtering anywhere. I did however on the IC-706 in my wife's van. You mileage on this is guarenteed to vary.

Hello Charles
All the FT100 needs is a good ground at the radio and at the antenna. If you remote the radio you could possibly need ferrite on the separation cables. If good grounds don't solve your problems then you probably have one of the radio that needs some internal grounding mobs. Send it to yaesu in that case. Mine needed the mods,and I went thru all the garbage I seen discussed here before finally sending it to yaesu. It came back cured.

Dr. Mark,
;-)

If you could I would love to hear from you regarding who has said
that they have changed the SS whip for the ATAS 100.
I have heard that folks have done it, but to what gain / detriment of
the antenna?

I am thinking of doing the same thing when I get mine next month, I
am just wondering about the same question that you have.

Well I have both radios and while the FT-100 is a nice radio it has
the usual bugs (as discussed on this board) and needs to go back to
Yaesu for updates however I think I will wait and see if I ever get
my FT-8500 back. It was 4 months out of warranty and I sent it in to
Yaesu in January. I call every 3 weeks and hear the same old
story...they are waiting for parts from Japan. I haven't had to send
my ICOM back so who knows what will happen there but for what is
worth I'm not impressed with Yaesu service.

Yes, and it provided no effect. If a few wraps around a torriod doesn't get
the job done, coiling the coax around an air core doesn't stand much of a
chance.

Jamie,
I went through 2 FT-100's in 1 week last year. They both smoked in less than 5 mins. Buy the Icom 706G, I did and it is the BEST radio in it's class on the market at this time. It may be a little bigger, but it will out perform the Yeasu FT-100, and I have had no trouble with it. Check out the 706G listing here and you'll find not much wrong with this radio, unlike the FT-100 and it's ATAS antenna. I'm sure in a couple of model up-dates (Mkll - Mklll) that the Yeasu FT-100 will be a radio with little to complain about, but until than go Icom! Trust me, I've been down that road and it's not all smooth!

Congratulations on your upgrade. I always think of backpacking rigs as being QRP rigs simply because anything other than QRP operation requires you to carry a heavy battery. The FT100 and 706 consume enough power in standby mode that I don't think either would be appropriate for backpacking. You might want to look into a QRP CW rig for operations where you have to carry your power source with you.

Again, in a dorm, you will want to have a stealthy antenna and run low power if you're concerned with RFI. I get into my cable TV set and stereo on 10M quite readily and many others who I have chatted with on HF have similar problems simply because the large fields emanating from the antenna are so close to the wires connected to these devices. Sometimes you have to put ferrites on everything, which is OK if it's your own equipment that is picking up the RF. That's not too easy to do if the RF is getting into some stranger's TV or stereo. If you're in a neighborhood, you may be far enough away from your neighbor that you shouldn't have to worry about it, but in a dorm...well, it's harder to have higher density living than a dorm.

You might be a candidate for a good used HF rig. Many of them are fully depreciated and you can get one for about a third the price of an FT100 or IC706. When it comes time to sell them to upgrade, you can get most of your money back out of them.

One thing people never think about is the fact that you pay for miniaturization, and small is not always good in a radio. [Passive filters for one take room.] [Compare the price of a desktop PC to a laptop if you don't believe me that miniaturization isn't free.] One idea would be a used rig.

If you are going to QRP and you want to build something, why not consider the Elecraft kits:
http://www.elecraft.com/
At every Pacificon, these kits have the biggest crowd. Anyway, it's an idea. If I remember correctly, these kits used optical encoders. I hate to harp on encoders freaking out, but it really bugs me. I know the optical one never wear out.

Regarding the guy who smoked two FT-100's, I hope he didn't inhale.....

I've had the 706 before I replaced it with the FT-100.
Can't tell you which one I would pick if I had to do it again.

Both have strong points and weak points in different areas. The FT-100's
Noise Blanker and DSP wins hands down (at least for mobile use) where the
706's NB was useless.

The 706 let's you name memory channels which I was disappointed with in the
Yaesu not having. And the 706 I think has better TX audio.

The FT100 is fitting in a place the 706 would not fit and that was a big
plus.

You can find used 706 MkI's in great condition for $500-$600.

From: Rod Greene
Topic: 3132 Message: 3132

Ignacy,

A couple of us guys here in Boise have our ATAS100s mounted on top of our vehicles (mine is a Ford Explorer and my friends is a Subaru Outback). The antenna works well and we haven't found a need for supplemental grounding. We are using the 3 pod mag mount.

Rod W7ZRC
~~~~~~

Date: Tue, 18 Apr 2000 03:25:54 -0400
From: Red Hat Linux User <ignacy@...>
Subject: Magnet mount and ATAS-100
I tried a few CB antennas from RS with my FT-100. The efficiency was poor and I had to add a few ferrite beads to avoid seeing the Hi SWR icon. Last week I picked up a 3-magnet mount and hamsticks. Great efficiency in comparison and no SWR problem. I think it is not only increased antenna lenght but also increased capacitance of the magnet to the body of the car and thus better grounding. Still, trips to screw and change hamsticks take time.
I am wondering whether somebody has tried installing ATAS-100 on such a magnet mount. It has only a 3/8 inch thread, but adding an extra socket should not be hard. Another issue is how to avoid paint scratches. The mount has plastic protecive covers, but when the magnet is removed it makes an edge contact with the paint.

3133. ATAS100 versus 102" whip

Yahoo group: FT100 (1998 — 2000)
Date: 2000-04-20 07:34:23 UTC
From: Red Hat Linux User
Topic: 3133 Message: 3133

Aside from checking SWR, did you do any checking on the antenna effectiveness? The antenna may tune but most of the power may stay in the coax. The ARRL handbook lists resistances and reactances of a 1/4 wave whip for 10m. Unless one has high Q coil, the efficiency of shortened antenna drops dramatically at 30m and and below. Your coil in the tuner has moderate Q, and the effective Q is decreased by lossy coax. If you increase the length of the coax, the tuner will tune even on 80. Even if the whip is removed.
Ignacy, NO9E

Ralph:
Well, that's a rather limited answer. Keep in mind what I said about how the shield is grounded at the antenna and where the cable runs from there. There is also RF current on the wire used for the ground. If that ground line is anything but a very short path, and essentially to the outside of the vehicle, then it will radiate energy inside the car. If the transmission line going away from the antenna is directly exposed to the immediate field, energy will couple onto it and again radiate inside the vehicle. So will any other exposed wiring or metal parts that aren't RF bonded to the body.
In reality, and I know this is going to cause some flames, the RF ground at the radio is irrelevant. What you need to do is to make sure that there is minimal RF on the other lines running into the radio (mic, speaker, contol head cable, power line) relative to the radio chassis! In reality, if you have significant RF inside the vehicle, grounding the radio itself can (in some cases) worsen the problem. Don't interpret this to mean that I don't suggest doing it, only that you need to be aware of the possible effect and deal with it.
Again, you either need to install the antenna in such a way to minimize RF inside the vehicle or you'll have to deal with the increased RF with additional bypassing or choking of lines going into the radio. Since there's usually other equipment inside a vehicle that may be sensitive to RF, my suggestion is to concentrate first on the antenna installation, grounding at the antenna and routing of the transmission line.
That all said, there do appear to be some FT-100's that have an internal problem and that need to be dealt with separately. But, I don't think you can simply assume it's the radio just because you have a "ground" at the antenna and radio.

Jerry,
It may look odd, and be hard to mount on your van, but have you looked into the Screwdriver antenna?

One model is a hard mount type, the other is a magmount type.
Hard mount- 80-10 mtrs.
Magmount- 40-6 mtrs.
Currently have 2 hard mount, and 1 magmount type.
I have been running the Screwdriver (s) for years.

Just a thought. Good luck.

Hi All,

I sent my ATAS100 into Yaesu a few weeks ago. Then called
to confirm the problem I was having with it.

(Would not move and no connection between the center pin
and ground).

I got it back with a note that they were unable to find
anything wrong with it.

I put it back on the RV and it's working just fine now!

Is there anything that tends to be intermittent with
these antennas?

I just HATE it when a problem just "goes away"!

3138. ATAS-100 needs Counterpoise de KA6K

Yahoo group: FT100 (1998 — 2000)
Date: 2000-04-20 20:20:02 UTC
From: tomellett@aol.com
Topic: 3138 Message: 3138

Hello Group:

I want to high lite the good advise I got from Mike Jones (KF6SWI) on the need for a good counterpoise on the ATAS-100.

Mike wrote me this note regarding my trouble with tuning the ATAS-100 on the HF bands:
----------start----------
Most likely, its not a matter of ground plane, it's a matter of counterpoise. The design of the ATAS is such that it doesn't require a ground plane for HF, but it does require a counterpoise. The counterpoise being...the 'other' half of the antenna.

I would recommend running a heavy braid groundstrap from the trunklid to the frame. Make it as short as possible; or in a couple hops (like from the lid to the quarter panel, then from the quarter panel to the frame)

Once you've done that I would suspect that the most you should have to do for 12m/17m is touchup the tune with the manual-tune up/down buttons.

Mike
----------end----------

I can relate to this "need for counterpoise" since I have a Cushcraft R5 for my base station and it has a really neat counterpoise at the base of the antenna.

Anyway, thanks very much Mike, for this explaination of the ATAS-100. I suspect that quite a few other folks are having H-SWR conditions on some of the HF bands and think, as I did, that it's lack of a good ground plane.

I'm having no other problems with my new FT-100 and ATAS-100. So, I'll proceed to get a good heavy ground strap to the frame as soon as I can. Also, I'm planning to post pics and documention of my installation on the OneList file directory too.

Any other comments or recommendations are appreciated!

I have used the Spider with its adapter, giving it 7 band capability. I was able to get a decent swr on all bands, although as I recall the bandwith on 40 was about 30 khz and 75 was about 10 khz (pretty worthless). It was mounted on the rear of a Geo Metro and on the
upper bands did well. The big drawback I felt was in its construction design. There is no stinger on top, nor is a spring recommended. The result was that coils were breaking constantly every time it brushed a branch or bush. I switched to a screwdriver (W6AAQ) antenna which gives complete coverage (75-10) and works alot better. I also tried a hamstick, but never could get it to work at all. Gus

I have a ATAS-100 mounted on the trunk of my 94 SHO. I have no tuning problems at all. I used a trunk mount that attaches with two allen screws. I is mounted just above the trunk hinge. This type mount does not damage the paint as much as a magnet mount.

Good luck.

Hi all,
Well I took delivery of my FT100 last week and I've been busy installing it along with the YSK-100 remote head kit. Along with that I've made new brackets for my homemade DK3 style screwdriver and fitted that to my new car also. Thanks to Ralph K6MOG, who supplied me with info and diagrams on automating the DK3 with the FT100. I spent most of Saturday building and perfecting it for my use as I still wanted to retain the manual adjustment to get me onto 80m. (I learned not to use dil8 packaged 6v reed relays to operate larger 12v relays).
Yesterday I got the Hands Free mic working, making an adapter from an old modem socket to a 8 pin mic plug (a real one!), doing some tests last night it's sounding good, the main unit is Velcro mounted to the roof lining.

Well I hope to work some of you from my mobile. I'm getting some good reports with my FT100 - Automated Screwdriver - Hands Free operation.

I've took some pictures and put them on my web page along with my old installation.
please take a look.

Jim
I don't know about the rest of the group but I would be interested in any schematics you have worked out for automating the DK3. Perhaps you could post them to the files area so that the rest of the group could have the benefit of what you and Ralph have been able to work out. I am using a DK3 manufactured by Don Johnson and find that it work great but automating the setting of the antenna would be even better. My brother KU4GP uses a similar antenna in his mobile set up.

From: Mike Ketchum
Topic: 3145 Message: 3145

Hello all,
I know this is off topic, but I am hoping a few of you might be able to help anyway. I have an FT-530 HT that I have decided to put to use in the 4x4 during offroad use. What I need are a couple suggestions for some good Hands-free accesories for that radio that will work with the radio's VOX circuit.

I saw in an HRO catalog the YH-2 Headset/boom mic, but I am not sure if it will utilize the radios VOX. Any confirmations on this or any other suggestions would be very much appreciated.

Thanks for your time,
Mike
N7XGN

P.S. One more thing. Does anyone have any opinions on the Yaesu Power Supplies? I have been looking at the FP-1023 to use with the FT-100 in the house. I need the dual AC voltage feature that it has and was just wondering how the rest of it holds up.

Thanks again,
Mike

From: Brett Miller
Topic: 3152 Message: 3152

I've been a ham for over 10 years and my purchase of the FT-100 is my first venture into the mysterious would below VHF. I need help figuring out what to do about an antenna. I've tried to read a lot of stuff, but I just get more confused.

I'm going to primarily be using this at home. Mobile may be in the future, but I've never been a fan of huge antennas on my car.

I was looking at getting a G5RV or Carolina Windom antenna to mount somewhere on the roof/trees etc. I have a simple 2 story house on about 1/4 acre. I can't put any radials on the ground because of small kids etc.

I initially thought I could hook up a G5RV and let the rag chewing begin. But then I started reading about antenna tuners, baluns, transmatch devices, high SWR problems, and now I don't know what to do. I do understand antanna theory, but I do not understand how these principles are applied to the various commercial and home made equipment.

I'm only a tech+ (prior to the no-code license) so I think I only have voice TX rights on 10m (& above). I can live with that until I see how I like it. So is an antenna tuner a foregone conclusion with most antenna types? I assume that unless you can be assured that your antenna will always be matched for where you want to transmit, a tuner is just a fact of life. The AT-11 from LDG looks nice (although coverage for 6m would be nice too).

Now if I have a tuner, can I just mount a windom or G5RV and start talking? If I want to save some money, should I just use a random wire and a balun hooked to the tuner? Is ladder line or balanced feed line necessary?

Last question: Would it be worth getting the ATAS-100 and mounting it on the house roof, just to keep my mobile options open, or is this antenna a major compromise compared to a wire antenna? DO I still need to get a tuner if I use the ATAS-100?

As you can see, I'm a bit confused. Any help would be appreciated greatly. Id really like to start using this cool looking FT-100 soon!

Brett - N7OLQ

Brett:

I'll try and answer some of your questions, ask you some more and offer a little advice.

The FT-100 is fixed output impedance, 50 ohms, and will require an antenna system that is close to that to work correctly. (on transmit) You can receive with anything although your sensitivity may be reduced.

G5RV's will not meet that requirement without an antenna tuner.

If you want to only transmit on 10 meters, a simple dipole is small, about 8 ft on a side, easy to put up and should work without a tuner. Some adjustment of the element lengths may be required.

A low cost CB vertical will also work if the element lengths are shortened about 10%. The A99 vertical would work well, not cost much, and be easy to put up.

As a tech+ you are now eligble to upgrade to general without a code test, only another written exam. Do it.

To operate on all the HF frequencies, the situation gets more complicated. The R7000 vertical suggested is one solution, it is clean and neat and easy to put up. It costs a few bucks though. A G5RV and a tuner would also work, costs maybe a littles less, requires more room and a central support. I have heard very good things about the LDG tuner and it is automatic, a very nice feature. Cheaper manual tuners can be bought but they are a drag to retune when you change bands.

Multiple dipoles can be put up for the bands of interest. Trap dipoles work pretty well too. I have used the carolina windom and it works very well but really requires a tuner.

There is a matching tuner for the FT-100, the FC-20, it also tunes automatically and has a memory of tune settings so QSYing is quick. It has less range the the LDG tuner. It should work OK with the carolina windom and possibly the G5RV. It is not likely that it would work with just any random wire.

Enjoy. If you have any other questions just ask.

Best bet is to join a local ham club if you can find one
and get some one to help you. All hams like to help other
hams with antennas. You'll get lots of advice, lots of
stories and make lots of mistakes. My advice is keep it
cheap and simple, and plan on doing it over again as you
learn. Then you will have stories to tell as well.

I understand all the question you have. I have in the past had many of the same myself. I'm currently using a G5RV and the FC-20 tuner that came with my FT-847. My G5RV is really a modified inverted "V". But none the less it works well. I was able to work 15 countries on 10M in 4 days (Not really trying) and recieved good signal reports from evryone I talked to. No I am not on top of a mountain, and I am sure more elevation on the G5RV would help, but as I said it does work. One last comment, is that the FC-20 will tune 160 - 6 meter on it.

Hello all,

I purchased a ft-100/ATAS100 system and instantly had trouble.
I couldn't get the atas to tune on 12/10 meters. It would state that
the swr was okay however, while in usb during voice peaks the swr
would rise above an acceptable level. In am/fm it would be fine. All
lower bands were fine and seemed to work well. After several phone
calls and many changes to the install in the car. I shipped the rig
and ant. back to Yaesu. In three weeks I had it back and it seems
(knock on wood) that everything is working well. With the rig on a
small tag it stated: "replaced thermal switch and updated SWR
ATAS100 tested to spec".. I like the rig and antenna. Let see how
long it last under my rigorous use and abuse..

Richard:
This has been said numerous times in the past, but keeps coming up. While there have been some problems with some FT-100's there do not appear to be any significant problems that Yaesu isn't fixing. Much of the bad reputation the FT-100 received was as a result of a relatively small group of owners. I think if you ask the people on this list, an overwhelming majority would say they are happy with their radio.
In regards to the FT-100/IC-706 comparison, I have both and much prefer the FT-100. The IC-706MKII I have is not the "G" model, so it doesn't have UHF or the automatic repeater offset functions of the newer one. Still, most of it's operational aspects are consistant between the two radios. Both the radios, the 100 and the 706, have been back to the manufacturer due to failures. The FT-100 lost TX on UHF and the IC-706 suffered a total failure. Both came back in short order and have worked fine since. The only problem related to this was that I had a bit of a difference with Icom repair related to me paying for them to install options in the radio that I had pulled out (at their request) to make sure it wasn't the options causing the problem. They eventually gave up and removed the charge.
The two things that I see as significant differences are the noise blanker and DSP behavior and the menu operation. In my opinion, the noise blanker and DSP are much better on the FT-100 except that the automatic notch filter function isn't quite as deep on the FT-100 as the IC-706. The IC-706 also has much more trouble with the noise blanker and strong signals than the FT-100 does.
The difference in the menus is significant. The FT-100 has a single button to scan through the menus while the 706 has groups of menus and two buttons to select them. This results in fewer buttons/menu on the 706 and no easy way to know where you are without looking. On the FT-100 you can push the menu button until you get a beep and count from there, then hit the desired function. Also, the FT-100 has a direct access button to the DSP functions that pretty handy.
Operationally, the FT-100 and the IC-706 seem to both be quite capable and I've done well using both (the FT-100 is in my truck and the 706 in my wife's van). I personally lean toward the FT-100, but I think you should go play with both and make up your own mind. In any case, there's nothing really to worry about with the FT-100.

From: J & D Schnoor
Topic: 3160 Message: 3160

I have been a subscriber for a while, but just received my FT-100 this week. Two concerns:

1) Memory Groups; the manual states 6 broups of 50 memories each. Can I can more than one memory bank at a a time?

2) Display; I transmitted on 2-meters FM this afternoon and the display went blank. I reduced the transmit power and no problem. I am using 9913 to a 6m/2m/70cm vertical. Any ideas why the display went blank?

Thank you in advance. Jim AA0FJ

Two ft-100's up in smoke in the first week, poor AM performance, no att/pre-amp for vhf/uhf, way more intermod than the 706G and no att to use to help fight it in downtown/base use, fans that are noisy or don't come on soon enough (hence the smoking action), The ATAS is a nightmare to get set-up and performance is limited, the 706G is $200 cheaper ($1699 cdn) to buy now than the Yeasu, should I go on?

NO troubles with the Icom 706G and better performance overall! Smaller is not always better... I found that out.

Wait till the FT-100 mkiii, maybe by than they will have most of the quirks worked out. Best to test drive both and go from there and remember all one has to do is read all the posting about the FT-100 from the last year and you can't help but wonder why anybody would even consider the FT-100 at this time! Do your homework and goodluck!

Hello again group,

I have also " played" with both rigs. I decided upon the ft-100 because of the simpler layout, less congestion of menus ,and price. The 706 isn't a bad rig but just didn't seem to be right for me. I'd like to see some backlit buttons and so fourth for night time operation in the car. however that seems to be my only gripe.

Good point Doc,

But It wasn't because I installed it wrong or anything else like that. I have had over 25 big and small radio's in the last 20 years not to mention being an electronics tech and service manager, and not one radio I ever had,Yeasu incl. had a record like the FT-100 has got in less than 6 months! In my option the FT-100 is a great idea and I wished it lived up to all the hype but sorry to tell you the radio doesn't live up to it's great sounding brochure! Maybe someday, but not today! It has got alot better since being released, but don't try to tell me that you can't read cause anybody that can, could tell you people are having trouble still with this radio and the ATAS. Maybe you got one that was returned and sold as new again after they replaced the main PA section and modded the thing to-death, like maybe the two I returned!? I'm sure they didn't just throw them away... not for me! To many things that can act-up later on and cause intermittent problems etc. Dummy- up and admit the Icom has been around for over 5 years and has been through the teething period, Yeasu will get there too soon enough, but for now Icom has the lead! Period!

> Yeasu, should I go on?

I have never seen the 706 MK II G cheaper, usually it's about $200 US more.
Maybe it's the reverse in Canada.

Not to say the 706 is a bad rig, both it and the FT-100 have good and bad
points. But it's hardly the nightmare depicted in some of the posts here.
I have had mine since January with no real problems. Had trouble tuning 10
m at home, but solved that by changing the length of the coax to the tuner.
I'm working the world in my car and home and having fun.

Jack, the atas is very fussy to get working with good vswr's on all bands. You have to play around with braiding, coax lengths, poor performance on vhf/uhf... that's all I'm saying. And if you want to buy a 706G for $1699 cdn funds ($800 us), go to www.radioworld.ca in Toronto and buy one. American's get about 50% exchange rate... lucky people! The Ft-100 is $1899 cdn for your information and ALL prices are current as of this posting.

Well, since you asked...Considering you have posted this experience 14 times
on this forum, I'd say you don't need to continue with this tirade any more.
We can look it up in the archives if we would need to read about it again.

From what I can tell, you smoked a few radios (after modifying them), got
upset with Yaesu even though they exchanged the first one and refunded the
purchase price on the second, and now you're using this forum to vent your
spleen and exact revenge on Yaesu. I've heard this story enough times that
you're just coming across like a vengeful customer and are no longer
providing a 'helpful' attitude that I've come to expect from members of this
forum.

Sooorry Lee,
I don't want to sound like a broken record, but someone asked a question about the two radio's and I'm telling them my experiences and opinion. And no, I didn't mod the radio, it didn't work long enough to get to that yet. If you want me and others to sugar coat the radio and expect all members to say only good stuff about the FT-100 than maybe we should re-name the community to " FT-100 - The best radio ever built! Only good/positive comments need be posted here, we don't want to hear the bad stuff. Sounds kind of communist to me Lee!? What ever happened to freedom of speech?? Your an American from what I can tell Lee, you should know about that stuff right? Enough said... happy hamming and catch ya around the bands! ;)

I don't believe you get a 50% exchange rate in the US from this dealer.
Their scanner page has US prices:
http://www.radioworld.ca/swscan/scusmail.htm
The ratio looks more like 25% off for US customers. The current exchange
rate is:
1 Canadian Dollar (CAD) = 0.6753 US Dollar (USD)
as found here:
http://www.oanda.com/converter/classic

Regarding Icom versus Yaesu quality, I am not exactly thrilled with my
current Icom mobile, especially the controls, let alone the intermod I get.
[Model 2700 if you are interested.] Yaesu has a reputation for delivering
products full of bugs. [BTW, I do have a Yeasu FT50, so I have no concerns
about buying from Yaesu, but I don't want to be the first to get one.] FWIW,
I will wait for this new Kenwood and if the features are what I want, case
closed. Kenwood has a better reputation for delivering working product out
the door.

You have to play around with braiding, coax lengths, poor performance on
vhf/uhf... that's all I'm saying.
And if you want to buy a 706G for $1699 cdn funds ($800 us), go to
www.radioworld.ca in Toronto and buy one. American's get about 50% exchange
rate... lucky people! The Ft-100 is $1899 cdn for your information and ALL
prices are current as of this posting.

Just had to put my 2 cents into it!
I've had the FT100 and ATAS100 antenna for one year now. Radio has yet to fail me. ATAS100 antenna quite working after one month - HRO/Yaesu replaced it - no charge in about two weeks. I have the antenna mounted on a '95 Pathfinder tire rack with the radio under the seat with the head on my stering colum. I've worked the world using this rig. No SWR problems on all bands 40 and above. I Greatly recommend both!
Andy

Hello all,

I purchased a ft-100/ATAS100 system and instantly had trouble.
I couldn't get the atas to tune on 12/10 meters. It would state that
the swr was okay however, while in usb during voice peaks the swr
would rise above an acceptable level. In am/fm it would be fine. All
lower bands were fine and seemed to work well. After several phone
calls and many changes to the install in the car. I shipped the rig
and ant. back to Yaesu. In three weeks I had it back and it seems
(knock on wood) that everything is working well. With the rig on a
small tag it stated: "replaced thermal switch and updated SWR
ATAS100 tested to spec".. I like the rig and antenna. Let see how
long it last under my rigorous use and abuse..

I am debating which rig to get ..the FT 100 or the Icom 706.
I keep hearing these problems with the FT100 even though I am leaning
towards
it.
Give me some feedback.

Subject: Re: New to the group..

Richard:
This has been said numerous times in the past, but keeps coming up.
While there have been some problems with some FT-100's there do not
appear
to be any significant problems that Yaesu isn't fixing. Much of the bad
reputation the FT-100 received was as a result of a relatively small
group
of owners. I think if you ask the people on this list, an overwhelming
majority would say they are happy with their radio.
In regards to the FT-100/IC-706 comparison, I have both and much
prefer
the FT-100. The IC-706MKII I have is not the "G" model, so it doesn't
have
UHF or the automatic repeater offset functions of the newer one. Still,
most of it's operational aspects are consistant between the two radios.
Both the radios, the 100 and the 706, have been back to the
manufacturer
due to failures. The FT-100 lost TX on UHF and the IC-706 suffered a
total
failure. Both came back in short order and have worked fine since. The
only problem related to this was that I had a bit of a difference with
Icom repair related to me paying for them to install options in the
radio
that I had pulled out (at their request) to make sure it wasn't the
options causing the problem. They eventually gave up and removed the
charge.
The two things that I see as significant differences are the noise
blanker and DSP behavior and the menu operation. In my opinion, the
noise
blanker and DSP are much better on the FT-100 except that the automatic
notch filter function isn't quite as deep on the FT-100 as the IC-706.

The
IC-706 also has much more trouble with the noise blanker and strong
signals than the FT-100 does.
The difference in the menus is significant. The FT-100 has a single
button to scan through the menus while the 706 has groups of menus and
two
buttons to select them. This results in fewer buttons/menu on the 706
and
no easy way to know where you are without looking. On the FT-100 you can
push the menu button until you get a beep and count from there, then hit
the desired function. Also, the FT-100 has a direct access button to the
DSP functions that pretty handy.
Operationally, the FT-100 and the IC-706 seem to both be quite capable
and I've done well using both (the FT-100 is in my truck and the 706 in
my
wife's van). I personally lean toward the FT-100, but I think you should
go play with both and make up your own mind. In any case, there's
nothing
really to worry about with the FT-100.

Subject: Memory Groups and Display going blank

I have been a subscriber for a while, but just received my FT-100 this
week. Two concerns:

1) Memory Groups; the manual states 6 broups of 50 memories each. Can
I
can more than one memory bank at a a time?

2) Display; I transmitted on 2-meters FM this afternoon and the display
went blank. I reduced the transmit power and no problem. I am using
9913
to a 6m/2m/70cm vertical. Any ideas why the display went blank?

Thank you in advance. Jim AA0FJ

Subject: Re: New to the group..

Two ft-100's up in smoke in the first week, poor AM performance, no
att/pre-amp for vhf/uhf, way more intermod than the 706G and no att to
use to help fight it in downtown/base use, fans that are noisy or don't
come on soon enough (hence the smoking action), The ATAS is a
nightmare to get set-up and performance is limited, the 706G is $200
cheaper ($1699 cdn) to buy now than the Yeasu, should I go on?

NO troubles with the Icom 706G and better performance overall! Smaller
is not always better... I found that out.

Wait till the FT-100 mkiii, maybe by than they will have most of the
quirks worked out. Best to test drive both and go from there and
remember all one has to do is read all the posting about the FT-100
from the last year and you can't help but wonder why anybody would even
consider the FT-100 at this time! Do your homework and goodluck!

Hello again group,

I have also " played" with both rigs. I decided upon the ft-100 because of the simpler layout, less congestion of menus ,and price. The 706 isn't a bad rig but just didn't seem to be right for me. I'd like to see some backlit buttons and so fourth for night time operation in the car. however that seems to be my only gripe.

The transmit worked fine on 90% power. Does the FT-100 actually draw 22amps
on 50 watts 2 meter FM? I am using a 20 amp supply.

Good point Doc,

But It wasn't because I installed it wrong or anything else like that. I have had over 25 big and small radio's in the last 20 years not to mention being an electronics tech and service manager, and not one radio I ever had,Yeasu incl. had a record like the FT-100 has got in less than

6 months! In my option the FT-100 is a great idea and I wished it lived up to all the hype but sorry to tell you the radio doesn't live up to it's great sounding brochure! Maybe someday, but not today! It has got alot better since being released, but don't try to tell me that you can't read cause anybody that can, could tell you people are having trouble still with this radio and the ATAS. Maybe you got one that was returned and sold as new again after they replaced the main PA section and modded the thing to-death, like maybe the two I returned!? I'm sure they didn't just throw them away... not for me! To many things that can act-up later on and cause intermittent problems etc. Dummy- up and admit the Icom has been around for over 5 years and has been through the teething period, Yeasu will get there too soon enough, but for now Icom has the lead! Period!

I have never seen the 706 MK II G cheaper, usually it's about $200 US
more.
Maybe it's the reverse in Canada.

Not to say the 706 is a bad rig, both it and the FT-100 have good and
bad
points. But it's hardly the nightmare depicted in some of the posts
here.
I have had mine since January with no real problems. Had trouble tuning
10
m at home, but solved that by changing the length of the coax to the
tuner.
I'm working the world in my car and home and having fun.

Well, since you asked...Considering you have posted this experience 14
times
on this forum, I'd say you don't need to continue with this tirade any

more.
We can look it up in the archives if we would need to read about it
again.

From what I can tell, you smoked a few radios (after modifying them),
got
upset with Yaesu even though they exchanged the first one and refunded
the
purchase price on the second, and now you're using this forum to vent
your
spleen and exact revenge on Yaesu. I've heard this story enough times
that
you're just coming across like a vengeful customer and are no longer
providing a 'helpful' attitude that I've come to expect from members of
this
forum.

Sooorry Lee,
I don't want to sound like a broken record, but someone asked a question
about the two radio's and I'm telling them my experiences and opinion.
And no, I didn't mod the radio, it didn't work long enough to get to
that yet. If you want me and others to sugar coat the radio and expect
all members to say only good stuff about the FT-100 than maybe we should
re-name the community to " FT-100 - The best radio ever built! Only
good/positive comments need be posted here, we don't want to hear the
bad stuff. Sounds kind of communist to me Lee!? What ever happened to
freedom of speech?? Your an American from what I can tell Lee, you
should know about that stuff right? Enough said... happy hamming and
catch ya around the bands! ;)

No offence guys, but it was ICOM who's tried 3 times to get the IC-706 right (IC-706, IC-706MKII, IC-706MKIIG) and in my opinion they still didn't correct some things they should know about. In contrast, Yaesu came out with a pretty good radio in the FT-900 and if you actually listen to the majority of FT-100 owners, the FT-100 is working pretty well for them. For the life of me I can't figure where this supposed reputation for delivering radios full of bugs comes from but my guess is that it has a lot more to do with the Internet than it does any real problems with Yaesu. I've been around radios for a long time and have seen every manufacturer have problems from time to time, but I would be hard pressed to pick any one of the major manufacturers over any other regarding the number of problems in their radios. I think Yaesu does a pretty good job of producing radios and particularly of dealing with customers.
In any case, I'm seriously considering replacing the IC-706 in my wife's van with another FT-100, if that tells you anything.

I also do not understand where the false impression of Yaesu putting out a poor product are coming from. In the past I have owned radios from virtually every manufacturer, and the only problem I have encountered was an out-of-warranty service from Icom. (do not get me started) I currently have a FT-847, VX5-R and the FT-100 as the mobile. If all the different radios I have had in the past had worked as well as these three I would never have owned anything else.

Sorry group,

I error'ed in calculating the exchange rate. You see I bought some stuff at Burghardts in South Dakota when I was there earlier this month, and the exchange rate on my Visa was 0.476 . So a $100 us. item costs $147.60 Canadian. I thought it would be the same the other way up here. You see sign's everywhere in Winnipeg that say US. exchange is 50% today! Again I'm sorry that's not the case, but you can still get great value for your dollar if you visit Canada for a holiday etc.!!

>And if you want to buy a 706G for $1699 cdn funds ($800 us), go to
www.radioworld.ca in Toronto and buy one. American's get about 50% exchange
rate... lucky people! The Ft-100 is $1899 cdn for your information and ALL
prices are current as of this posting.

The price may be current but the exchange rate is in error. Per Yahoo!
Finance the rate is CDNx0.674992 which results in a USD price of $1281.81
for the FT-100 which is a little more than AES's recent price of $1099!

But I don't know if there is a cell block advantage in buying Canadian. Who
cares about cell anyway?

I think the answer to the problem is very simple: All the hams pleased with their rigs are busy using them on the air and don't have time to get on the Internet to complain about them. This group is no different than all the others, however, there is still information to be gleaned, making a visit worthwhile.

I hit "tune" and it tunes low vswr on 10, 12, 15, 20,and 40 (I don't work 30) automatically. No fuss, no muss. I didn't play with feed lines or ground straps, I mounted it through the roof, as recommended. No nightmares involved.

Already have an FT-100, no need to buy a 706 also. Not to say there's anything wrong with the 706, just don't need one. Glad you're happy with your 706.

Yaesu Bugs? Look at the Yaesu VX5. The original has some weird feedback problem, couldn't scan to save it's life (missing freqs in use), and the CTCSS was dog slow. The latest version is still left with horrible CTCSS, to a degree I consider unusable. The VX5 will be replaced with a better model sooner than later. The fact they still sell the FT50 testifies that the VX5 isn't up to snuff. The FT50 has a bug list as well:
http://www.qrz.com/mods/ft50r_1.txt
The low transmit volume problem went away and I figured I could live with the rest of the bugs, so I bought one.

I am not defending Icom either. In fact, I am so unhappy with my 2700 that I'll be hard pressed to buy an Icom anything (except maybe that cool scanner with the TV screen, but only in a moment of weakness). Now you can't call Icom's progression of 706 models bug fixes. New features were added to the radio, the last being 440. That is different from in-line design fixes that yaesu is doing.

There are two mutually exclusive tasks that need to be solved to sell new products. One is to innovate at the expense of reliability as new does not equate to tried and true, while the other is to deliver quality. "Standard" was the last to market with just about everything, but the products were good. Yaesu was the first out there with new features, but the product was full of bugs for at least a year. Now "standard" is history from what I can tell, so maybe Yaesu has a better market plan. Kenwood is in the middle. In fact Kenwood is such a diversified company that they may not even look at ham radio as a P&L center, but rather something they do because the company was found on radio.

No offence guys, but it was ICOM who's tried 3 times to get the IC-706 right (IC-706, IC-706MKII, IC-706MKIIG) and in my opinion they still didn't correct some things they should know about.

I just bought the FT100 an hour ago at AES Orlando for $999. I believe the
$100 coupon is through the end of this month.
By the way, I wanted the 2.4 SSB filter but they told me it was discontinued.
I got the HV7A antenna from Diamond. It is a lot cheaper than the ATAS plus
has the fold over feature for getting in the garage. You can do only 2 HF fxs
the same time though but that is not a huge problem. It does 70cm, 2m, 6m and
the 2 HFs.
I bought the coils for 15m 20m and 40m.
Now all I have to do is figure out how or where to mount it inside the
FourRunner.
Maybe under the seat with the remote but in Florida it gets real hot in cars
especially under the seat.

Gary:
I started writing a response to your comments and got the feeling of
Deja Voux (sp?). I checked the archives and it appears that we've had this
discussion more than once before. I think the success of the VX5 (which my
wife and I both own), the FT-100 and other very popular Yaesu radios
stands without further comment, so I'll refrain from continuing it other
than to say that I think Yaesu would be well within their rights if they
were to take you to task for your comments.

Good point Doc,

But It wasn't because I installed it wrong or anything else like that. I have had over 25 big and small radio's in the last 20 years not to mention being an electronics tech and service manager, and not one radio I ever had,Yeasu incl. had a record like the FT-100 has got in less than 6 months! In my option the FT-100 is a great idea and I wished it lived up to all the hype but sorry to tell you the radio doesn't live up to it's great sounding brochure! Maybe someday, but not today! It has got alot better since being released, but don't try to tell me that you can't read cause anybody that can, could tell you people are having trouble still with this radio and the ATAS. Maybe you got one that was returned and sold as new again after they replaced the main PA section and modded the thing to-death, like maybe the two I returned!? I'm sure they didn't just throw them away... not for me! To many things that can act-up later on and cause intermittent problems etc. Dummy- up and admit the Icom has been around for
over 5 years and has been through the teething period, Yeasu will get there too soon enough, but for now Icom has the lead! Period!

Sometimes, just sometimes, does anyone wonder if it's operator/intaller error? Sorry but my FT-100/ATAS-100 works great; has from day one. Enough said.

We are all a part of this Lets make it as good as possible.

I'm sorry, but Yaesu would not have any legal grounds against me. All the bugs I have mentioned are 100% real, some of which Yaesu fixed. Remember, I do own some Yaesu stuff and may still buy the FT100, but I will not blindly say that Yaesu doesn't sell bug ridden products to a higher degree than other ham companies, at least initially. That would be denying the facts.

Regarding the VX5, you will note that this product mainframe has not found it's way into any Vertex products the last time I checked. {vertex website down at the moment.] No commercial user would accept VX5 performance on CTCSS. Even the new VXA-100 is using the FT50 body. If the VX5 had a future, Yaesu would spin it into new products. This is done to amortize the non-recurring R&D costs.

You only have to look back to the post by n1qkw to see a DOA unit, albeit fixed now. Then there is the mystery need for 20ft of coax to make the thing work. Clearly there are still some quirks to the FT100, though it looks like none are insurmountable. Like I did with the FT50, when I think it will work as well as it is going to work, I'll buy one if nothing else is better on the market.

3185. Back on the road with HF

Yahoo group: FT100 (1998 — 2000)
Date: 2000-04-30 00:47:40 UTC
From: George Haneke
Topic: 3185 Message: 3185

I have monitored this group since getting the FT-100. I am a truck driver and wanted a radio for the truck. I needed a small radio that could be mounted on top of the CB. I needed an antenna system that would allow me to change bands without stopping. I checked out what was available on the market and settled on the FT-100 with the ATAS-100.

Mounting the antenna required some special consideration. My truck is all fiberglass from the frame up. It is a KW T-2000. I found a location behind the sleeper where I could mount the HF antenna on a grab rail. I had to keep the height below 13'6" total. Scales are touchy about that on trucks. I mounted a Comet dual band on then opposite side. I had to ground both to the frame with heavy gauge wire to the frame.

The system worked well on most bands, except 6 meters. Haven't got it solved yet, but still have some ideas. I had to add 18' of coax to reach from the back of the truck to the radio. The run had to look good to get by DOT inspections.

After a few weeks, the ATAS would not tune. Observation revealed that it was not retracting. I removed the antenna from then mount and found water in the mount. It had not rained for a couple of days. Further investigation found the base of the antenna was full of water. I removed the base, drained the water and finished taking the antenna apart. Dried everything. I check voltages on the coax and found they were correct. I manually retracted the antenna and put it back together, but it would only extend. I was scheduled by the house in a few days, so I took it back to the store I had purchased it at. They explained that it would have to go back to Yaesu for repair, probably four to six weeks. I considered some alternatives, bought some single band antennas and left. I could not run down the road with the single band antennas without relocating the mount. They were just too high. I looked at the ATAS again and decided that I could replace the base unit with the motor controller and that would take care of the problem. I was unable to locate a source for the part. I had found that the motor ran the antenna up or down when a 6 volt DC was applied to the plug that goes to the controller card. I drilled a small hole in the antenna, and ran a small wire pair to the cab, and checked to see what the antenna would do. It tuned fine in a manual mode. I built a box with a switch and now tune the antenna manually. It works fine. I have taken a few steps to keep water from getting into the antenna. I used a cable tie on the base of the boot. I also put a small amount of clear RTV on all the screw heads, around the the grommet I had installed to run the wire to the motor.
